Question to me is good too, but if you can solve the problem without me, I prefer ;-)
I just need to check some times the discussions because I don't want people spread some false or incomplet informations...

Usually. The ST 13-pin video port outputs analogue RGB, together with separate vertical and horizontal synch pulses (it also SUPPOSEDLY outputs composite synch, but in actual fact it outputs composite video)

If your monitor has a composite synch pin only (such as the microvitec "cub" series) you'll need to combine the vertical and horizontal synch pulses - I think this can be done with just a discrete OR gate, which you can make with two diodes and a resistor.

The hardest part is getting hold of a 13-pin DIN plug. I haven't found anyone in the UK that still has them in stock, though I don't know how hard they are to get overseas. Of course, if you don't mind cutting an extra port hole in the case, you could remove the 13-pin din socket from the PCB, solder some flying leads into the holes it leaves, and replace it with a 15-pin D or scart connector or something.

All these possibilities are relatively inexpensive. Most connectors and cables that you need can be acquired for under a fiver.

Tom

6315. Atari ST stuff for sale!

Newsgroup: comp.sys.atari.st
Date: 2003-09-09 15:02:36 UTC
From: jonny_morrisuk@yahoo.co.uk
Message-ID: <f6895097.0309090702.4e97b4d9@posting.google.com>
Source record: 23897

Hi

Atari ST sofware:

Games -
Stardust (STE)
Rocket Ranger
Falcon
Goldrunner
Substation (STE)
Zero-5 (STE)
Elite II: Frontier
The Choas Engine
Epic
F1
Robocop
Cannon Fodder
Starglider
Starglider 2
Electronic Pool
Powerdrome
Driller
Reach for the Skies
F-16 Combat Pilot
Battle Command
Toyota Celica Rally
Paradroid 90
Batman
Trivial Pursuit
Xenon II
Badlands
The Empire Strikes Back
Return of the Jedi

All boxed etc.

Other software -

Calassistant
Image Copy
Stereomaster
Vidi ST
Warp 9

There is also the Atari ST with external hard drive and complete Link
setup too, with manuals, ST Basic, mouse, joystick, etc. All working.

Reason for sale: switched to an iMac.

Will split as required, but would like to sell the Atari ST hardware setup as one. The ST was used as a midi sequencer so has a copy of Cubase (unofficial!) already setup on the hard drive (along with lots of other software) as well as the Cubase book.

Any reasonable offers considered!
Games will probably cost around 1 or 2 UK pounds each to post within the UK, depending on what heavy manuals they may have. Will post to UK only.
Not sure on postage of the hardware, but I imagine it may come to around 8-10 UK Pounds or more so personal collection is welcome (Scarborough area).

Thanks!

6316. True Paint & SpeedoGDOS for sale!

Newsgroup: comp.sys.atari.st
Date: 2003-09-09 15:10:53 UTC

Hi

I have the following for sale:

True Paint (ST & Falcon compatible)
SpeedoGDOS (ST & Falcon compatible)

Boxed and complete, excellent condition.

Any reasonable offers! UK only please.

Thanks.

These are in the Maplin catalog but that said I asked this question a while
ago and was told only the monochrome signal could be handled by a standard
multisync, some older ones like the microvitec could handle all three rez's

Me too. The "good" drive just lost its file system, will not keep
partition type, and announces its name twice, with variations, on a bus
rescan. So I need another drive too.

Have not seen the dual announce of name before, which HDDriver interpreted
as master and slave, I think.

Probably a bearing problem, but very hard to get apart.

Jim

The original pcb is small enough to lay in an original ST.
However, I don't know about Lyndon's one, but as it will
have 2 joystick ports, it will be hard to make it so compact
as Laurent's one. It is more likely it will be an external
module - but who knows what Lyndon is able to ? :-)

L>with it, but on the Hades060 it's due to self modifying code. If such
L>code ends up in the cache at the wrong moment then it causes problems.

Well, for all of you who are interested. The sources have been sent to several still active developers. I hope that one of them finds a solution soon.

Unfortunately the NOVA VDI isn't open source but I respect Gerhard's decision and hey that's better than nothing.

If that is a GFA example, you might want to call the equivalent bios()
function, as PRINT triggers toswin2's console on the bell sound.
Example: ~BIOS(3,2,7)

6330. CT60 ATX power supply issues

Newsgroup: comp.sys.atari.st
Date: 2003-09-09 22:17:54 UTC
From: Carey Christenson <falcon060@adelphia.net>
Message-ID: <1063127102-948248AEicMi@adelphia.net>
Source record: 23910

Anyone,
I have made a cable that will allow me to use the FALCON to program the ABE and SDR and new TOS into the CT60. My question pertains to actually getting the power supply to power up the CT60. I have a 250 watt ALLIED model #AL-A250ATX power supply. It has a "I" and "O" power switch right on the power supply but still does not power the CT60. Is there a couple of wires on that 20 pin connector that can be jumpered to power the CT60 up so that I can program the ABE and SDR??? Or what needs to be done. I put a jumper on the CT60 between the 2 pins for the ATX power supply which I thought would have turned it on. Do I have to have the CT60 completely installed into the Falcon to program it??? I have not soldered the resistor on that LVC245A chip yet so I figured it could not be installed yet till I have that ABE and SDR programmed. Any help you can provide on this matter would be greatly appreciated.

Thanks,
Carey C.

I didn't talk to Wizztronics. For one thing, you have to replace the
provided power supply with one that has the ATX connector. I'm not
particularly inspired to cold-call the guy, but the email address I'm
using is a real one, and I'll be happy to respond to whatever
questions he has.

Hi, Lyndon!

Just read that the eiffel just maps scan codes. I did believe that
PC keyboard adaptors always would include "swapping" of the key positions.
But at least eiffel does not. So with eiffel you can take a PC keyboard
and modify the keycaps to get closer to the atari style of keyboard layout
(which I like more) ;-)

So put me on your list for one eiffel as well!

Alexander

6333. Help converting Cubase Audio Falcon song file to MIDI file

Newsgroup: comp.sys.atari.st
Date: 2003-09-10 01:41:57 UTC
From: "Paul N." <visit_my_site@nurmix.com>
Message-ID: <govslvsb8u7ebtfm705bht20hnkerr48ca@4ax.com>
Source record: 23913

Well, my Falcon appears to have finally died today.
:-((

I was trying to run Cubase Audio, and I got a message that there was no key (aka 'dongle') inserted in the cartridge port. The dongle _was_ there, but that error message happens every once in a while due to age and dirt on the contacts I suppose (even though I've cleaned them). So, I turned it OFF, re-inserted the dongle, powerd back up, and then... nothing. Dead bird. I get no video. I do hear the internal drive start to spin up, and the power LED comes on, and stays on, but that's it. No other activity. I haven't tried to diagnose the problem any further yet, but I'm sure it's something that can be fixed.

The real pressing matter is that I was right in the middle of a music project that I need to finish within the next couple of weeks. I can finish most of it in the ST version Cubase on my STE, as long as I can convert the Cubase Audio "SONG" file into something Cubase version 2 will recognize - attempting to load the CAF song file into Cubase 2 does not work.

So, if someone here uses Cubase Audio Falcon, I would love to send them the song file (it's very small, only MIDI data, and an unfinished song at that), so that they could load it into CAF, convert it to a standard MIDI file, then resend it to me so that I can make use of it in Cubase on my STE.

Any takers?

Thanks in advance.

What you could also do is run Cubase Audio on the STE, that is if the
dongle itself is ok. It should work, it'll just have the audio disabled.
That is how I exported my CAF songs after being forced to switch to Mac
because of my dead Falcy.

Maurits.

If you thinking about VGA or SVGA then adaptors are available for purchase however due to the higher Sync frequencies for these monitors the only resolution that gives a stable and usable output is ST High (monochrome) whichc is ok for most applications but no good for most games.

Try B&C (www.myatari.com) in the US or Atari Workshop (www.atari-workshop.co.uk) in the UK if you want to purchase them although I'm sure other good Atari retailers stock them so trawl the net.

This is probably a stupid question but are you are sure you
re-inserted the dongle in the right way up!
It can be an easy mistake to make if your not paying attention, if it
is inserted correctly so if she files without it.

[franglais]
After test, AT(1,1) is not necessary if ';' is present.

Therefore:
Print Chr$(7);
or Print AT(1,1);Chr$(7)

> If that is a GFA example, you might want to call the equivalent
> bios() function, as PRINT triggers toswin2's console on the bell

>file locking problems magic has on real hardware.

My file system of choice happens to be FAT32 on real hardware. MagiCMac uses
the Mac file system and that's not FAT32. It's about time you and some other
idiots finally grasp that this is a Atari newsgroup, and I do not report or
comment on stuff running under emulators (and virtual machines).
As a Mac user you should know that a Mac uses HFS & HFS Plus, not FAT32, so
once again you're posting bullshit and off topic...
It's a good thing this group isn't moderated or you would be blacklisted :-)

>He's not going to bother to test ext2, that requires installing and reading
>docs and or man pages. ;-)

Of course I'm not going to bother, mainly because it involves more then just
reading crappy written docs. I do not intend to repartition a hard disk just
for the sake of it...

But instead of bitching be constructive for once and tell the ignorant people
here the advantages of using ext2 vs FAT32, who knows, if you're convincing
enough, some might start using MiNT and repartition their hard disk....

Cheers from Belgium

>> papyrus.
>
>Yes, but Cab is unusable as a serious web browser and in that aspect WAY
>too expensive. Papyrus does what I want it to do, apart from some tiny
>glitches and is way better value for money.

That's a very weird comparisation....
Because Papyrus does what you want it to do and CAB doesn't, CAB isn't good value for money? CAB does everything what is promised by the promo. But this applies to a lot of programs of course. As for CAB, I've found that products I've purchased from ASH have always been worth the asking price at the time of delivery. I was told what it CAN do TODAY, given an opportunity to test drive it, and the price for it. It may not be suitable for serious browsing today, but that wasn't an issue at all some six years ago, and since there's still no better alternative around on this platform...
Papyrus promises a lot also, but doesn't deliver the goods... and that is something completely different. You may be a very satisfied custumer, but I for one am not. Papyrus is a productivity tool, instead of being productive with it, one has to eat his heart out... There is no demo version of Papyrus 9.xx available either, one even has to do an extensive search to find out what has changed/fixed/added since version 8.xx.
If you purchased CAB for example 5 years ago for $50 bucks...and used it only twice a week since... I'd say there's little to complain about. Drive a car for 5 years and tell me it's still like new or that you did not get your 'money's worth' from it. Code isn't much different really.....no platform is immune from this analogy. At some point you make a choice to live with what you have, or buy your way out of obsolesence...

>Actually, the only annoyancy that comes to mind right now is the fact
>that the mouse clicks "through" the popup menus, ie if there is a button
>behind a pop-up menu, you'll accidentally press it when selecting an
>item. Or if the document window is behind the popup, you'll place the
>cursor under the mouse by clicking a pop-up item. But I got used to
>dragging popups instead of clicking them, that helps.
>
>There's probably more but I don't even remember.

There sure is :-)
The problem with a program like Papyrus however is that some users will never ever stumble upon it shortcomings. If you don't need a certain option, you're

not going to find out that it's buggy either. It's not a big issue really, I can't use Papyrus for the stuff I need to do, and you can't use CAB for the sites you wanna visit.... I use a different program, you however have to wait until something better appears or browse on a different platform.

Papyrus has a history list of bugs which have never been fixed that is at least a mile long. Giving a detailed list would lead us to the longest post ever writen on USENET so here's just a small selection (note that almost all these bugs are known by ROM and that Ulli Ramps promised several times in here to fix them ASAP).

-It still can't handle GEM/3 vektor images properly, a couple of years ago Ulli Ramps promised here that it would be fixed in the next version (7.xx), and that Papyrus would also be able to handle ArtWorx files, it's not fixed and Artworx files are not recognised at all.

-Import a MS Word doc, save it in RTF format, quit papyrus, restart and load that RTF file again.... Papyrus can't make head nor tails from something it generated itself.

-Try to let Papyrus automatically number the pages of a manuscript, although almost every wordprocessor worth his money has this function, it's still not there. It's possible, but not very practical...
If someone would want to number pages in a rather orthodox way, for example place the numbering in the middle of an outer left or right orientated page then he'll have to use whichcraft...

-Bitmaps transparancy mode only works in monochrome, using colour vektor font overlays, isn't possible because of this. Remember this app boast to be more or less a replacement for Calamus....

-Using vektor objects in true colour mode, is asking for disaster... Papyrus either screws up the colours, or can't make head nor tails from it anymore and displays & print the whole lot in glorious monochrome...

-Try to reformat or assign a different font to a predefined paragraph in a document, nine times out of ten one ends up with a screwed up document.

-Loading the Dutch dictionary into Papyrus takes almost 22 minutes on the TT, and that is unacceptable... Loading a 850 pages long thesis in Papyrus takes almost as long, and that is also unacceptable. Before I can start typing one single word, I've got to wait almost three quarters of an hour...

-Take that 850 page manuscript and try to print it backwards with opposing left and right view... one will end up with 850 pages rubbish.

-"What you see is what you get" doesn't apply to Papyrus, because the screen resolution doesn't match the printer resolution, and this makes the program worthless for doing fine detailed work (although it's claimed that this is possible). Papyrus relies on the screen drivers of NVDI, since these were never ment for this kind of work, it lacks accuracy.

-When the printer is off line and you need to print a document, putting it online causes Papyrus to drop the first 8 characters, and I don't care what

fancy name ROM gives this, I my book this is a (annoying) bug.

-Its also still not possible to lay a bitmap partly over a vektor picture, although it's claimed differently.

-Open a document in for example 1024*768, insert a bitmap picture that covers an entire page, save the document, reboot in a smaller resolution, reload the document.... see Papyrus crash.

-Footnotes are placed in the footer of the document, that's just fine until the user wants to add some additional stuff to the footer. If for example I put a vektor object in the footer together with the title of the manuscript nine out of ten times, the footer will be screwed up by the footnotes. It can be fixed manually, but when the document is reformatted, for whatever reason, the user has to do it all over again. I could just as well use Luna!

-When a picture is inserted into text, the text flows around that picture, like many features in papyrus, this also has shortcomings. The user can move and place a picture so that it's on two pages, this shouldn't be allowed by the program, furthermore the hyphenation rules of Papyrus are made clearly for the German spelling, when text gets hyphenated it usally needs a lot of manual correction, especially when usng the method of text flowing around a picture this is very annoying. And switching hyphenation off, is no solution either because of the ugly wide gaps between single words...

-Papryrus has no spooler, it relies on the NVDI printer spooler. I don't have to tell anyone here what kind of problems that spooler can cause on certain occasions, especially for TOS and/or MiNT users.

-Papyrus is dead slow, that's not a bug or missing feature, but something the user has to live with anyway.

etc...

Add the bits of groveling from Steve to this list and it should be clear to anyone that this program is not all what its made out to be. All this isn't necessarily bad, I'm convinced that many Papyrus users never ever face any of these shortcomings, simply because they only use certain features of the program. But people who do need these features...

Cheers from Belgium
Dennis

Hi Neil,

>I am interested in finding:
>
>>Studio Scan (French program)
>>TMS Scan Design (German program)
>
>Are they PD or commercial? Does anyone have any clues
>for where to look?

Both programs have (had ?) the commercial status, but finding a copy is easier said then done. Sometimes Peter Denk Gmbh has a copy of TMS Scan on offer, as for Studio Scan however...:-(
Peter Denk can be reached at: http://www.ATARI-Fachmarkt.de

>I have GT Look2 and a SCSI Epson GT9500, but I'm looking for a program
>that works better.

The translated Epson GDPS_SC 2.2 app should be in your mailbox right now. Scanning with your Epson will never be the same again... :-)
With any app that knows the GDPS protocol you can from now on import your scans straight into the program, edit, touch them up, look at the preview and save them.... Calamus, PhotoTip, Papillon, OCR, Tempus Word, Photoline, PixArt and ScanIt are just a few of the GDPS compatible apps.

For more info or help, mail me...

Cheers from Belgium

From: paul.williamson@zetnet.co.uk (Paul Williamson)
Date: 03 Sep 2003 22:14:15 GMT

Hi Paul,

>I'm always pleased to see more software coming out for the Atari. O.K.,
>it might not be perfect, and if you've spent money on it you expect it to
>work well.

So am I, it's no secret that I prefer working with the commercial stuff
either, in general commercial/shareware software tends to have more/better
features. And usally it takes advantage of features offered by my OS of
choice...

>But how many PC users are constantly disappointed by the bugs
>in their software, and then, after upgrading it and just as they hope it
>is working O.K., MS announces they won't support it any more. You are
>forced to upgrade even if you don't want to, or the features you bought
>it for won't work any more (e.g. I had to upgrade from IE 5 to 6 or I
>couldn't continue to access the secure sites). Soon no doubt, I will be
>encouraged to spend on another version of Windows as MS won't keep
>supporting 98.

That's all very sad and unfortunate of course, but the above applies to all
platforms including this one. The difference between this platform and others
however is that the users have choice. You've choosen to use IE as browser,
you could just as well use Netscape or Opera... MS stopping support for five
years old software isn't all that exceptional either, try to get support for
Calamus 98 from Invers for example, you'll be encouraged to upgrade to the
newest version.
To stay on topic: I've upgraded from Papyrus 4 all the way up to 8.23, and
just like these PC users I've been constantly disappointed by the bugs in the
program. But for some reason it's OK to say this about PC software but not
about Atari software. We should all be very gratefull that someone out there
still bothers to release something for this platform, even if it's not really
up to standard... and we certainly shouldn't complain. Well, sorry Paul, but I
have to work just as hard for my money as a PC user. If I payed good money for
something I expect at least something usefull in return... if not I'll start
moaning :-/

>It's a far from perfect world, but I find most of the Atari platform
>software I use gives me fewer problems, and far more pleasure than the
>Windows stuff. I include Papyrus in that. I use it a lot, both on the
>PC and the Hades, and find very few problems. (The only ones that
>bother me are on the Windows version !)

So do I, but that's partly because lots of the Atari software comes with litle or no "bells and whistles". If you compare Papyrus feature by feature against some of the "monsters" on the other platforms, Papyrus turns out to be a quite simple program. And let's face it, Papyrus has never been the most stable or debugged word processor around on this platform. But because it's the only one available in English and until a few months ago about the only one that was still being developed, we can't ignore it... Personally, I'm through with Papyrus and will not upgrade to the newer version if it ever appears, ROM doesn't even offer a demo version of version 9.xx, for having to find out what exactly has been fixed/added/changed in this new version one obviously needs a crystal ball. If you ask me all they are trying to do is to cut the grass away under the English Tempus Word NG which should arrive around christmas. The new Papyrus X is due any minute, and they are trying to stuff version 9.xx in our throats... You just wrote you don't like the MS tactics concerning upgrading stuff very much, what do you think this is?

Cheers from Belgium
Dennis

>could you (and Dennis) tell me what better programs there are on the
>Atari platform as far as Word Processors/Databases that are *not
>limitted to German-speaking/reading users*, is capable of reading MS
>Word, and handling HTML fairly well?

If these two features are important for you then the answer is very simple
really: there aren't any. AFAIK Papyrus is the only program that's able to
import *some* MS Word docs, and at the moment it's also the only one who
can handle HTML.

>I personally haven't seen anything else, and while I've run into a bug or
>two in version 8.23, it is for the most part, a very tight program on my
>system, and worth every penny of its price (IMO, of course). If you can
>show me a better program, I'll check it out. Otherwise, I personally don't
>understand what all this Papyrus/ROM-bashing is all about.

Bashing?
I didn't bash anything, I wrote: "So am I, and bugs can be cured like you
say, but I've been waiting for some odd 6 years now, to see some of these
bugs being fixed. The authors either don't care or can't fix them at all"
Is that bashing Papyrus?

Showing you a better program is very difficult, not because it doesn't
exist on this platform, but because "better" is a personal definition. It
all depends a bit on what you use the program for. I'm convinced that a lot
of Papyrus users would be quite happy with Cypress 1.73 for example, it's
free and translated by DDP. But it lacks some features which Papyrus has,
if you don't need these features however...

And you've probably seen the post from Norbert Simon about Tempus Word NG
which will be available soon in English? Instead of writing a sleazy add,
I'll just point you to the website http://www.tempus-word.de , even if you
don't understand one single word of German, playing with the demo should
give you an impression what a "real" document processor is all about.
This is the program that can compete with word processors on different
platforms, after 14 years of development, about any bug has been fixed, it
has a very impressive list with features, and unlike Papyrus, all these
features are implemented in a logical and practical way (IMO). Tempus Word
is the most advanced word processor available for this platform, and soon
the English, French and Dutch speaking users will be able to use it also.

And last but not least: someone here said that 99,9 % of the Atarians are pleased when new/updates, expecially commercials ones, see the light. Well, unlike Papyrus, Tempus Word NG isn't a ported PC program, but a real Atari program... give it the benefit of doubt and wait a few more months before upgrading to papyrus 9.xx, I promise you that it'll be worth the wait...

Cheers from Belgium
Dennis

All IKBD cmds are supported in the version 1.0.4 excepted :
SET_MOUSE_THRESHOLD
SET_FIRE_BUTTON_MONITOR
CONTROLLER_EXECUTE

Cmds added :

GETTEMP (3)
PROGTEMP (4)
PROGKB (5)
PROGMS (6)

Regards,

Didier.

Me too. On Atari for me it is the Lindner binary with LaTeX 2.09 (later one(s) are a bit too large for my disk).

>It's so much more reliable than
>glossy wysiwyg programs like Word, and it's usable with codemanagers and
>the likes. So especially for large scientific works, LaTeX is often used.

Indeed, it seems to be one of the rare programs which do the finer details of the typesetting trade as they shouldbe - e.g kerning, ligatures, boxes, etc. In fact, I am inclined to think that TeX/LateX long ago solved all theoreticall problems regarding the algorithm of typesetting texts on a computer. For making a more comfortable environment instead of the command line interface of TeX (and it can be quite horrible, especially error reporting), it should be sufficient to make an input and display wrappping around the proven TeX "machine". TeX by itself need not exclude "wysiwig".

>Another great advantage is that large fully layed-out documents
>remain pretty small in filesize, since they're not stuffed with binary
>noninformation. And of course, no viruses. :)

And also, it is completely portable between different platforms- both the (La)TeX source and the compiled .dvi

Btw. I don't know the history of the RTF format, but it appears to be a (bad) imitation of the TeX source file format.

To my amazement, very recently I saw those connectors in several shops
around here. It seems that they have became fashionable again- something
related to CD players (or some other audio equipment) for cars.

My friend is de-cluttering his junk pile and will soon be throwing out a heap of old Atari ST software. Original boxes and manuals, almost mint condition, seems a shame to throw it in the bin.

He's not decided which bits he wants to keep but when he does is anyone interested in having any of it? Saves him a trip to the recycling centre.

Cheers, K.

Maplins used to stock them in the UK, possibly also Radio Shack.
Don't know if they still do. In the US, Best Electronics should be
able to supply.

Hmm, I hadn't thought of that. Of course there is the possibility
that the dongle itself somehow went "bad", and inserting it in my STE
might very well kill it too.
;-)

Anyway, I've already had the song file converted to a SMF, so I should
be able to get along fine with Cubase 2 on my STE.

Yeah, it was inserted correctly. And believe me, I unhooked
everything when I was trying to get it to work again. And even
tested the Falcon with another monitor just to be sure. All I get is
the power LED, the internal IDE drive spinning up, then nothing else.

And just thinking about it now, I'm 99.9% sure I actually turned it
OFF before removing the dongle after I got the error message that the
dongle supposedly wasn't there... In my haste, I wonder... could I
have actually pulled it out when the Falcon was powered up??? I don't
think so, I know better than that. But it was late, and maybe...

I guess I'll know for sure when I have a chance to open up the case
this weekend...

It's about time you and some other isiots finally grasp that this is a Atari newsgroup, and I do not report or comment on stuff running under emulators (and virtual machines).
As an Atari uses you should know that a MiNT uses TOSfs & FAT12/16/32 & Minix & Ext2, not HFS & HFS Plus, so once again you're posting bullshit and off topic...

> It's a good thing this group isn't moderated or you would be blacklisted :-)

I recall saying that mint has advantage over magic, and memory protection
makes mint more stable. The author of magic also then said these same
exact things, yet if I post such a comment is automatically bull...
Yet you don't have one word in reply to the magic author. I find that
quite funny. Everyone here can see that, you aren't fooling anyone.

Is it really too hard to utter the words... "sorry you were right,
I was wrong"? Apparently it is.

The only thing not being grasped here is the fact that MiNT and all it's
extras is just as valid as magic in this forum, if not more. It lets
others do some things magic won't, and from the magic authors posts, it
appears MiNT will do some stuff magic probably won't ever do.

Truth hurts doesn't it. lol!

I have been working with Wordplus 5 for years, but want something better.
I was thinking about Papyrus but will definitely also consider Tempus
Word. I will compare them as soon as new demo versions are available for
both, and will let this NG know which one I have decided to pay for.

Source record: 23750

I lost the previous post where we listed up to 10 or so of ST games which requires 1024 KB of RAM. Pls re-post the list for me (and other new ST users here).

If you know any ST/STe games that requires 2048 KB or more, pls add in the list, after you copy-paste "previous postings" to your new message window here. Once again, thank you!

Well, Mac does not have Geforce4/Ti capability - instead it uses Geforce4/Mx - two difference thing here. Ti handles real-time shadow, bump mapping, etc. vertex level.

PC can, unfortunately.

Mike

6374. Viruses, Worms, Trojans, Retrovirus, Hijackers, Spywares

Newsgroup: comp.sys.atari.st
Date: 2003-09-11 22:01:43 UTC
From: mstepansky@aol.com
Message-ID: <20030911180143.14261.00000696@mb-m18.aol.com>
Source record: 23756

Watch out for...

Viruses, worms, trojans....and now another breed:

Retrovirus - I think this one disables your AntiVirus software before you know it. A critical one.

Also, spywares/malwares (adwares) uses a small trojan code hiding in your PC (not sure about Mac) which can capture your privacy info and sends to hackers. They can get in your PC given to you by "spybots".

Worse than popup box is called hijackers - you browse a web page (first time) and then it hijacks you to adult sites, etc. then you realize this is NOT what you are looking for. Bad for kids.

Keyloggers is another thing, keep tracks of your keyboard entries and then send back to hackers for study.

Or, spyware can capture your screen information and email to hackers to study.

Solutions: download SpyBots-S&D 1.2 - excellent freeware (upgradeable; now detects up to 9488 spy libraries) S&D stands for Search/Destroy)

And for extra measures, get AdAware (Dell tech support recommended that to me) and SpySweeper.

I had 1 Trojan.Norio and 28 other spywares sitting in my PC!!!!! Killed them.

Not ALL antivirus is able to check trojans! My Trojan.Norio was discovered two weeks BEFORE Norton's AV recognized it!

HERO (my #1 favorite)
PitFall2
Centipede
Zone Ranger
Keystone Cops
Ms Pacman
SuperPacman
Jr Pacman
Pengo
whatever you have unusual titles - feel free to email me.

Disk-based...

Mr. Robot (disk?)
FlipFlop
Ollie's Follies (nice 3D style, like Mr. Robot)
JetBoot Jack
Encounter
Agent USA
Agent USA II (rare)
GumBall Factory
Oils Well (addictive - pacman style using oil drillers!)
Jumpman Sr. (I lost it)
Nadral (rare, Germany game)
whatever you have unusual titles...feel free to email me.

Any Teddy Bear or Hamster like games?

Mike

6380. Using a TT Want to use a Midex +..... Can I ?

Newsgroup: comp.sys.atari.st
Date: 2003-09-12 12:12:32 UTC
From: notator_logic@hotmail.com
Message-ID: <b662b21f.0309120412.597e3774@posting.google.com>
Source record: 23762

Got a TT running Cubase V3.
I wish to use a midex+ - it arrived today.

Before the correct driver was setup, it was acting like a key expander.... would allow me to boot to cubase with the dongle in a slot.
I had three different versions of the midex driver in Mros (114, 115 and one called midexfalc) Trying each of these - admittedly without a hard reboot - none worked, so I enabled all of them, hard reboot and now it shows up in cubase in the output box.

Only thing is, it's not showing any midi activity on either the two inputs, and nothing plays on the synth when plugged into any output (though the midi output indicator obviously flashes)

Does the TT suffer with the same problem as the Falcon where you can only use it as a dongle expander, or do I just need a certain mros driver for it.

My only other hope, is that I could plug a unitor into it, (or a log 3)

I already use an SMPii at the moment so that as an alternative is already used.

Thanks.. Rob

Hello, Dennis,
thank you for alerting the community (or maybe its just me!) about
Tempus Word. I will definitely check out the demo, and put in a
request for an english version. Its good to hear about alternatives to
whatever is popular at the moment. I think Papyrus is OK, but I always
wonder why some programs are more successful than others. I always
wondered why DA's Layout wasn't more popular than Calamus for example.
I have used Layout and thought it was such a GREAT program. It made
everything easy to do and you got great results.
Just my 2 cents, Mark

Steve,

"Whether a particular use of a Usenet posting is a fair use is, as always,
a very fact-specific determination. However, it's probably safe to say
that it's a fair use if the use was not commercial in nature, the posting
was not an artistic or dramatic work (e.g.,, it was the writer's opinion,
or a declaration of facts, and not something like a poem or short story),
only as much of the posting was copied as was necessary (e.g., a short
quotation for purposes of criticism and comment), and there was little or
no impact on any market for the posting."

Was the quoting an artistic, dramatic work?
Is there any business impact?

If you disagree and still want the post to be removed, private email
should have been used, not usenet.
Lonny could simply use a loophole, using a url link to a google search to
usenet. Same result, just this time, not liable.

Filter out the worst and _never ever_ respond to stupid posts without
adding some valueable information yourself. That's the only way to help
an unmoderated newsgroup stay as clean an informative as possible.

It was in it's entirety as it would appear on google groups. Which
apparently google isn't concerned with liable if you noticed.

I have since changed the spelling, but I won't take it down. My usenet
guide is informative and accurate, and gives good examples where needed.
If you don't want to be remember as such, don't talk that way. Funny,
I didn't think you cared what people thought. lol

Anyway, the people who have read it, pretty much say it's dead on.
If you don't like what's on my site, don't go there.

Hi Patrice,
Firstly, let me thank you for your work!
A few notes on Doom 0.30pre2 compared to 0.27 on my Falcon030, TOS 4.04,
PhantomSE excellerated)(640x480x256):

--- unfortunately it crashes after a about 5 minutes of play
--- loads faster
--- video runs faster
--- sound keeps up with video but is lower in pitch (ok for me)
--- joystick button moves the guy forward instead of firing (bad for me)

NG Note: It seems that I'm not seeing all the posts so I apologize if
if you (or anyone) has already replied to any of the above.
So, I'll keep checking your site for updates too.

> Galen

Hey Galen! My Falcon Rack arrived today, and it looks great! As you said,very sturdy construction. What he is selling for $99.00 is just the case, no power supply, cables, or even brakets for hard drives. Those were extra. That's good, since the needs for the CT60 are a bit different. I'll be looking for a power supply for the CT60, did you find a solution for yours? I'd be interested to hear what I should look for. I have not yet bought anything for the mouse/keyboard, and am waiting to hear how much the Eiffel will cost. Did you manage to fit the D.E.K.A. 2 in ok?

Hi Lyndon,
I'm interested.

Some questions:
--- From your site, am I right saying the cost is 39 euros + shipping?
If so, how much postage to the USA?
--- Will it be "bug free"?
--- Can it be used on any Atari? If I'm not mistaken, the keyboards on my
1040, Mega4, and Falcon are 3 different types (missed out on the TT :)

No need to wait for the latest demo of Tempus Word. The demo version available for download IS the latest; and is transformed into the paid-up version once you've bought a license key.

I need some help, I hope someone can point me in the right direction. Have recently purchased an old Atari 1040, but have no idea how to get cubase to work on it. It is to be part of a simple home studio. If anyone knows what a dongle is and how to get hold of one for this machine, that would be great.

I placed this question on a music makers group and the answers were very very funny, but not that helpful until one guy suggested finding this group. So here I am and would be greatful for any help and advice that you could give me.

Thanks

Dan Hall

Source record: 23790

From: lp <gfabasic@mint.net>
Date: Thu, 11 Sep 2003 14:04:18 -0400

>I recall saying that mint has advantage over magic, and memory protection
>makes mint more stable. The author of magic also then said these same
>exact things, yet if I post such a comment is automatically bull...
>Yet you don't have one word in reply to the magic author.

There's quite a difference between the author of MagiC commenting on *his*
program and you spreading your usual verbal noise. I don't need to reply to
the MagiC author at all in here, why would I? If I have something to say to
him I'll contact him via personal mail, I don't oppose his views either.

Andreas Kromke wrote:

<SNIP>
"Of course MiNT should be much more stable than MagiC, because of its
memory protection. Any wrong behaving program can crash MagiC at any
time. This is a really big disadvantage of MagiC, und therefore only
applications should be used that turned out to be stable."
<SNAP>

Would you be so kind to explain us, what happens to MiNT when one can't
run a certain app under memory protection? IIRC you call them "dirty hacks".
From where I'm sitting it doesn't make much difference, when I run a "dirty"
app under MagiC it might crash the OS, running that same app under MiNT will
do exactly the same thing. When running a "clean" app however MagiC will be
just as stable as when running that same app under the memory protection in
MiNT. A MagiC user needs "stable" apps and a MiNT user needs "clean" apps in
order to get a stable system, what the hell in practice is the difference?

Here's another quote from the MagiC author, this one however hasn't been
commented in here at all, makes one wonder why, doesn't it?

<SNIP>
"The last years of MagiC development on Atari hardware I was using an
old TT. In several years I never had any (!) crash, so in practice
MagiC on Atari was more stable than Win95. But, of course, I had my
set of well behaving applications that were not very hardware related.
The same is partially true for MagiCMac and totally true for
MagicMacX. The MagiC kernel itself is proven to be very stable, at
least with "standard" applications."
<SNAP>

All I can say is that I've got the same experience, we could of course start
a discussion now about the definition of "standard applications". And that
could be quite an entertaining discussion... somehow I've got this feeling

that anything I consider to be "standard" will be dismissed by you and vice versa ofcourse ;-)

>I find that quite funny. Everyone here can see that, you aren't fooling
>anyone.

How would you possibly know? I seem to recall that you don't read my posts. And once again you are off topic... this thread has got nothing to do with MagiC vs MiNT, I made it very clear from the start that it's about the crap that's being released for MiNT and is given the name Atari software. Turn and twist it as much as you like, but you won't find one posting, not in this or the other related threads from me where I actually have a go at MiNT. You and a couple others here seem to think that I've got something against MiNT. I'm even being called a MiNT-hater, how can anyone possibly hate an OS? It's no secret that I don't like the stuff that runs *on* it, so what? I happen not to be very wild about N.AES, IMO it doesn't do MiNT any justice at all, and looking back to the posts in this and related threads, I'm not the only one who feels like this. I like Jinnee better then Thing also, although that's purely personal taste. IMO it has a lot more features and is more functional, in combination with Scripter it's IMO unbeatable... on other platforms they could learn something from the Jinnee/Scripter combo.
So here you have it: in order to belong to the "good" corner I'm expected to run an OS with an AES that leaves a lot to be desired. I can still run Jinnee of course, but with severely cut features. As for the apps; I happen to run mostly "standard applications", these won't run any better and neither give any advantage, some apps will even have less functionality.
I'm just repeating myself... I've written this time and time again, but you and some others here, just don't wanna know it. You don't wanna hear that there is absolutely no advantage in me and others who have a similar setup switching over to MiNT. Who in his right mind is going to give up an OS and related apps which he knows through and through, just for the sake of it? And your tales about file locking are nice in theory, in practice however I've never experienced them, and I don't know one single MagiC user who experienced anything like it either...

>Is it really too hard to utter the words... "sorry you were right,
>I was wrong"? Apparently it is.

Right about what?
Since you reply to quoted bits and pieces you have no idea what we're on about, and you want to hear me say "sorry"? You must be living in coockoo land... You expect me to be sorry for having an opinion and expressing it? Wake up...
You happen not to like my opinions so you filtered me away, all you need to learn now, is to stop commenting on my posts... what's the use of filtering someone, if you keep replying to that person's posts?

>The only thing not being grasped here is the fact that MiNT and all it's
>extras is just as valid as magic in this forum, if not more. It lets
>others do some things magic won't, and from the magic authors posts, it
>appears MiNT will do some stuff magic probably won't ever do.

This is like an old cracked record, playing the same boring tune, over and over again. IMO there's nothing valid about these so called extra's, they only run on one of the three major used OS's and they have absolutely nothing to do with Atari whatsoever. Unix stuff doesn't belong in this forum... if they run under a MiNT setup, and if some people enjoy using them, fine, you won't hear me... if however that stuff is cheered in here as the next best thing, you'll find me on your path.

>Truth hurts doesn't it. lol!

Are you implying that I've been telling lies about something? Show us the proof or shut the hell up. You wouldn't recognise thruth if it was slapped in your face, your thruth is blurred, announce your so-called thruth on your website as much as you like, in here however different rules apply.

>FreeMiNT http://sparemint.atariforge.net/sparemint/ [The Future is now!]
>Team Atari http://setiathome.ssl.berkeley.edu/stats/team/team_21046.html

Nice sig Lonny :-)
So I presume that everyone involved with either sparemint and/or seti agrees with your views and the way you express them? LOL

>L. Pursell http://www.bright.net/~gfabasic/ [AtarIRC, GFA-Basic, Hades060]

Now that is an interesting link....
Especially those idiots guides is something which I've appreciated very much. They're not only helpfull, everyone here should at least read them and be up to date, but in addition they also are the evidence of a what a twisted brain is capable of. Anyway, you've got my nomination for the website of the year, but don't be surprised, if it gets a contender soon....

Cheers from Belgium
Dennis

Hi Adam,

>As an Atari uses you should know that a MiNT uses TOSfs & FAT12/16/32 &
>Minix & Ext2, not HFS & HFS Plus

As a Atari user I don't need to know anything about FAT32, Minix & ext2,
just like I don't need to know anything about HFS either. I happen to use
FAT32 under MagiC, that's my choice... and you know very well that under
MagiC I can't set up any Minix style partitions. Suggesting that I set up
such a partition, involves a lot of work and when asking quite politely
about the benefits, cons and pro's all I get is a: try it out.
Who said that MiNT'ers were helpfull again? LOL

>>so once again you're posting bullshit and off topic...

I'm right on topic, I seem to recall we were talking about using FAT32
versus ext2 when all of a sudden the moron who thinks that GFA basic is a
high level language felt the need to step in and drag the Mac fs into this
discussion, don't blame me...

>> It's a good thing this group isn't moderated or you would be blacklisted :-)

Hi Martin,

>I have been working with Wordplus 5 for years, but want something better.
>I was thinking about Papyrus but will definitely also consider Tempus
>Word. I will compare them as soon as new demo versions are available for
>both, and will let this NG know which one I have decided to pay for.

Let's clear up one thing, or this thread might develop into something like the MagiC thread.... I didn't ment to say that Papyrus isn't any good at all, just in case you got that impression, for most people it's perfect. And the large userbase is the proof of this, but for certain tasks Papyrus is not really suited. Until now, The English, French and Dutch speaking community had little choice. For the last odd seven years, Papyrus had no competition. Tempus Word NG is a contender, and like any other program it has certain flaws also, for people who need to process large manuscripts or use it for professional work it'll be a blessing.

When you try out the Tempus Word demo and would like to use/try the Dutch dictionary with it (Groene boekje + Kramers) containing almost 450000 words just mail me...

Cheers from Belgium
Dennis

Nope; it's still copyrighted, at least AFAIK and in most countries. Of
course, posting to Usenet means you're implicitly giving permission for it
to be reproduced on Usenet servers all over the world and archived by
sites like Google Groups. I don't know of any court cases that have laid
out just how far this implicit permission to copy goes, though. Also, a
ruling in one jurisdiction might have little or no weight in another.

>Just my 2 cents, Mark

Hello,

DA's Layout and Calamus are very different.
The first one is more ï¿½single-pageï¿½ oriented, with strong vector
editing capacities, the second is more multi-page oriented.
Moreover, Calamus is still under development, as DA's Layout has
been stopped.
And, as an end, DA's Layout is IMO nearly so expensive as Calamus
for at least half less capacities.
I bought both the products from start, so I can compare both.
I still use DA's Layout for vector or font editing, as for the
moment Calamus Lineart module is very... hem... say... light :-(,
but I use Calamus for everything else.

This might be the problem. However, the computer runs for a while
(generally at least 20 seconds, often longer) before crashing.

I have boot 0.99a. I downloaded Didier's package to get the GENERAL6
and CT60 .CPXs, but haven't yet had the time to make the required
cable.

> > What kind of ATX-power are you using? With older ATX-power I've had

This is interesting, as the Falcon had no trouble with the old power
supply (as an 030) but I now have a curious floppy light problem with
the new 250 W ATX supply.
> >
> > CT60 worked only about half a minute, sometimes little bit longer,

> look for. I have not yet bought anything for the mouse/keyboard, and
> am waiting to hear how much the Eiffel will cost. Did you manage to
> fit the D.E.K.A. 2 in ok?

I used a standard ATX power supply -- the mounting holes are correct
for it. I had to get an extension cable though (from Fry's
Electronics), so try to look for a supply with a long cable. It will
be helpful if the power supply has an on/off switch -- most don't.
You will also need a 11 pin HE13 connector, two 5 mm LEDS with holders
(power and ide drive), some wire and two switches that fit the
remaining holes, one a momentary switch(for power), the other a single
throw (for 030 vs 060). I found these at a local electronics supply
store.

The DEKA2 fit fine (the case was designed for it), and I'm using a
cheap PS/2 keyboard with an off the shelf Belkin PS/2 to AT adapter
and the typical Atari mouse. It's clearly an easier solution than the
Eiffel so far as our case is concerned. I have the digital joypad
ports and the cartridge port extended to the back, but if you don't
use these, there's no need to bother.

Does your case have the CD panel covered with a metal plate? If so,
be very cautious before you remove it. Getting a HD mounted to the
floor of the case is easy enough, but the two tier bracket I have
(5.25" over 3.5") is clearly a custom job. You may want to go with an
external CD.

Galen (who is starting to think his power supply might be causing his
problems)

A dongle is the equivalent of a physical key (such as the one you use
to start your car). A little smaller than a deck of playing cards,
the dongle contains a small amount of code and is attached to one of
the ports of your computer. To run the program, the dongle must be
attached.

Cubase was a program that used a dongle, and it should have been
included with your copy. I'd contact the person from whom you
purchased it to see what happened.

It still is, although you have to ignore a lot of bitterness. Steve,
Lonny, Dennis (among others) often contribute to this group with
information and advice. Unfortunately, the level of argumentation
(and profanity) has been rather unpleasant of late.

I've mentioned before that the currency of Usenet is goodwill. To
annoy others is to risk that others will stop reading your posts, thus
devaluing them.

Dennis u definately did no ask politely, but always inside some abusive message. If u would post normal question, maybe even a bit provokative, noone would say, try it out. Now ill make wild guess, prolly wrong one, that u want to know why i prefer ext2. Its simple, it is inode based and not FAT tables based. U prolly know that in FAT tables there are info bout files, where are they located, size etc. FAT tables are a lot more prone and touchy for corruption and especialy wiping all FATs in VERY short time, so realy easy to destroy them. If u dont have mirrors, u are toasted. Inode filesystem is prone to that, also files need to be physiscaly wiped out, so whern there is a panic, u can save a lot more... Since Magic cant use ext2 or minixfs i realy dont think why we should push this... Its just one of things i do like with MiNT, additinal FS, which is sturdy and fast, so platform may benefit. I doesnt change how apps are behave etc, so for Atari user transparent, same as HFS on Mac.

> Who said that MiNT'ers were helpfull again? LOL

I did.

> I'm right on topic, I seem to recall we were talking about using FAT32
> versus ext2 when all of a sudden the moron who thinks that GFA basic is a
> high level language felt the need to step in and drag the Mac fs into this
> discussion, don't blame me...

Well i also use GFA. Now how much knowledge and what u can show u produced with GFA, or C or ASM that u can call ppl morons on GFA base? Reason i drag Mac into discussion is that u keep blame us for using foreign apps. On MagicMAC u also, of nothing else, u use HFS, and open Transport, since Magic do not directly acces Mac ethernet or serial. (serial maybe?) And thats actualy no differens as ext2 or mintnet.

Is no-one else using 'Protext' word processor? I see many references to Word or Papyrus etc, with complaints about many bugs. Protext has very few bugs. Though not officially supported, there is an URL where an updated version is available (6.xx), which I have mislaid, unfortunatley.

Protext was the preferred prog for journos. The prog is still able to produce properly printed manuals.

Protext was available only for Atari, Amiga and PC, I believe.

Cheers,
Charles.

> practice is the difference?

Difference is that MiNT will not crash. App may crash, and since memory space is protected and can not be overlapped, MiNT will report crash, reg and BSS etc dump, clean the memory and that is... If u did experience Magic "system overschreiben" error, was quite nasty with v4, thats what happened, some of apps did acces and put own data into area, where Magic was.... Many apps dont obey those rules, so MiNT, if MP is enabled, dont allow those apps to run. Luckily for most cases, systems are both stable without MP so i personaly im not too excited, but is definately good feature, since OS prevent to run bad app, instead to run it and risk a crash. Somehow bad point is, that some apps realy behave kinda okay, but MP prevent them to runsince code is not MP aware (can overlap other app)

Well i do prefer Thing, reasons are that Jinnee is a bit to similar to MacOS for my taste (taste is personal thing), dont have UnixFS support (must admit that last version i tired was 2.0x) As i can recognize scripter as very usefull idea, i did also stated i miss it in Thing. On other side i got used to Thing's groups, and that feature also is very usefull. And this is not teasing, as it may look as it is: upper message is totaly acceptable and i and i think noone other wouldnt react, as i did, since your not liking or going wild bout NAES aint told in it sux, brainless etc style..

> So here you have it: in order to

> some apps will even have less functionality. I'm just repeating myself...

Dennis, since i belong to " u and some others" lets clear some things: i did not cheerish alien apps, or make a fuss. My initial message was that there is actualy no Magix or MiNT app, just plain Atari, or let say GEM apps. I just added that because MiNT with acces to HUGE Unix library, especialy on field of internet drivers, services and so on, not huge X apps, is im my view way to future, from simple fact, that its alive OS, has acces to loads of soft and it can adopt fast to eventual new protocols or even new machines. Untill clones are m68k there is not big prob, IF PPC apears, MiNT can adopt, Magic prolly wont. Same if interent change acces protocols etc. In NO message i either say Magic is bad, or suggest u or anyone change, on contrary, i like it, use it and suggest to anyone who havent particular urge for Unix, and i did say that loud and many times.

Yet u emediatley cassified me into lamers, dreamers whatewer class u invent, also in class of lousy coders bla bla... I can only see one reason, i had say that i like MiNT. And that was enough for u.... U did jump on me, so i wont keep shut. Remeber i did NOT say that Magic sux, or that future of Atari is Gimp or whatewer...

> I've written this time and time again, but you and some others here, just
> don't wanna know it. You don't wanna hear that there is absolutely no

> MiNT. Who in his right mind is going to give up an OS and related apps

> which he knows through and through, just for the sake of it? And your
> tales about file locking are nice in theory, in practice however I've
> never experienced them, and I don't know one single MagiC user who
> experienced anything like it either...

But i do hear that. Did i EVER suggest u to move to MiNT? Or anyone else. Please be my quest, check archives, and find me such message. Yet i was again put in that categories.... Some time back i really got pissed, called u name, but u did say things i NEVER did say...Also i many times said good stuff bout Magic, scripter etc, did u EVER recognize any of my MiNT reasons?

Bout file locking. Your view is like that Mac guy, claiming there is no OSX viruses so noone need to check for viruses. Not to safe, and u may think im moron, but u do know Magic user who suffered. Me. Since Magic is mtasking, i was during reorganising the hdd, write some text etc, move app folders etc, and on exit after few hours, magic crashed, hdd was gone and i even had to restore MBR of hdd.... And if i warned ppl bout that, since i didnt say magic is crap, but that its wise to take that in mind, that are tales for you...

>>The only thing not being grasped here is the fact that MiNT and all it's
>>extras is just as valid as magic in this forum, if not more. It lets
>>others do some things magic won't, and from the magic authors posts, it

> as the next best thing, you'll find me on your path.

So i shouldnt be happy if some app or driver, like NFS, which i personal really use a lot, make sharing betwen coding and test machine easy, and mustny say "i like NFS, it make my life easier" or i will loose Atari feeling? Problem u have is that u interpret that like im saying NFS is totaly ultra cool, Magic sux cause it dont have it, its genuine Atari app? In such case, please be my guest, stand on my path. U said u like jinnee scripter thing, did anyone opose to that? I actualy did say i like scripter idea. Did i opose and make noise since u use HFS? Nope, lately that debate did get in fire, but it was started diferently... What i want to say is: jinnee definatly used some Mac things, folder tree lists, spring folder, HFS support, type/creator bits support. It make life for u on MagicMAC easier. Allow me some percent of same stuff with MiNT, like NFS, ethernet even maybe knews/pine. I did use pine, i like the app, still as soon Amail was introduced, i migrated, and now only use pine for some alternative email addy with IMAP. If and when ill talk ppl into change to pine, and call it Atari app bla bla (remeber i called those apps necesary evil in some cases) then hit on me. Saying that i used pine, that has some nice

things is totaly different.

> So I presume that everyone involved with either sparemint and/or seti
> agrees with your views and the way you express them? LOL

Nope. But u on other hand, do. I did disagree with Lonny on same topics, and agree on some other, and suddenly i was his buddy, etc bla bla... U will need to realise i am NOT Lonny, or Frederic, or they arent me and stop bashing all ppl into one basket.

> Now that is an interesting link....

> soon....

Well i must say i dont exactly agree with this page... On other hand, it maybe just calling horse a horse as u said. And freedom of speach. Ill repeat, i dont agree with guides, bit heck, it is a taste of your medicine.

Janez

Hi Derryck,

>No need to wait for the latest demo of Tempus Word. The demo version
>available for download IS the latest; and is transformed into the paid-up
>version once you've bought a license key.

The German demo version comes with a German dictionary, anyone who would
like to try it out with the English pre-release dictionary (containing
almost 300.000 words at the moment) just mail me...

There are also Dutch, French, Spanish, Polish, Norwegian, Swedish and
Italian dictionaries in the pipeline, but except for the Dutch one these
are far from finished yet. The goal is to make a dictionary that is so
complete that the user never has to be bothered by the spelling checker
again, unless he makes a typo of course.
In a later stage a matching thesaurus for the above mentioned languages is
also planned, hyphenation files are not needed because local hyphenation
rules are incorporated in the program itself.

Cheers from Belgium
Dennis

Like eiffel, but emulation at 100% isn't possible because unused cmds
like CONTROLLER_EXECUTE need the original processor a 6301.

Regards,

Didier.

Maybe there are a bug, I havn't files for test Quake.
If I use ABS_MOUSE_POSITIONING (9) and INTERROGATE_MOUSE_POS ($D) cmds
at home inside a short test program, absolute position works fine.

Regards,

Didier.

Hi Frederic,

>If you disagree and still want the post to be removed, private email
>should have been used, not usenet.

That's a bit difficult... Lonny uses a fake address.
Which is rather amusing if you read his views on anonymous posters. The fact that he might or not be using his real name in here doesn't matter. He can't be reached. We don't know if LP is his real name, for all I know he could be Osama Bin laden... :-)

>Lonny could simply use a loophole, using a url link to a google search to
>usenet. Same result, just this time, not liable.

It depends where he's situated, some countries and/or states demand that you ask permission first to add a link to the owner of the site. Also note, that anyone can ask Google that his/her posts be removed from their database. So, although one can look up posts in Google and other archives, they're only there for informative reasons only. They're not ment to be used in any other way without the permission of the poster (usenet RFC rules).
But all this is theory ofcourse, in practice things (luckily) are different.

Cheers from Belgium
Dennis

Hi Mark,

>thank you for alerting the community (or maybe its just me!) about
>Tempus Word. I will definitely check out the demo, and put in a
>request for an english version.

No need to request it, an English version is planned, but large projects like these sadly don't happen overnight, although some people here think differently, it involves lots of tedious work not to mention time. But do not worry, it's on the way, if all goes according to plan then the first initial English version should be just in time to put under the christmas tree.

>Its good to hear about alternatives to whatever is popular at the moment.

Yep... :-)
BTW: I forgot to mention that Tempus Word can also use the Calamus fonts, that's another one of its unique features.

> I think Papyrus is OK, but I always wonder why some programs are more
>successful than others. I always wondered why DA's Layout wasn't more
>popular than Calamus for example. I have used Layout and thought it was
>such a GREAT program. It made everything easy to do and you got great
>results.

Hm... that's the one million dollar question. I never used DA's Layout so can't comment on it, but I remember reading some raving reviews about it, I also remember that it was a quite expensive application. Being popular involves getting your products known to the public. DMC and later Invers for example were shining examples, if there was an Atari show somewhere, you could almost bet anything you had that they would be there also. And although their software wasn't cheap, they always offered very tempting upgrade and/or cross-grades to Calamus. I don't think there was one Atari magazine that did't receive the latest info and previews of their software either, the same marketing strategy was used by ASH, and just like Calamus their products are/were widely known and used by the public.
Now it's different ofcourse, there are no shows anymore and sadly no more magazines either, so we all depend on usenet and some Atari news websites to get information... and that information isn't always correct.

Cheers from Belgium
Dennis

Hi John,

> --- From your site, am I right saying the cost is 39 euros + shipping?
> If so, how much postage to the USA?

I think you may have got this from Laurents site. I don't know yet on the costs, I need to know assembly time of each one. I source my components from 3 suppliers to get the best but cheapest components. I think Laurent used to make his PCBs himself, mine are made at a PCB factory.

> --- Will it be "bug free"?

For everyday use, it's perfect. I'm aware of a couple of bus with certain programs that people have reported to me (thanks) but AFAIK, these are only a few games. As soon as hardware is done, I'll concentrate on the PIC firmware, I have to work it out as it's commented in French :)

The PIC can be updated, very much like the CT60 chips. New versions can be put on with a home made cable, or I'll be offering a service to update them.

> --- Can it be used on any Atari? If I'm not mistaken, the keyboards on my
> 1040, Mega4, and Falcon are 3 different types (missed out on the TT :)

They all use the IKBD inside the keyboard. The only difference being, the Mega ST(e) and TT are in a 'pizza' box and have an RJ11 style connector. Two versions will exist, with simply different connectors on the end of the lead.

I've just sent the order off for some PCBs to be produced. Should get them in under two weeks.

>it was in it's entirety as it would appear on google groups. Which
>apparently google isn't concerned with liable if you noticed.

Read the Google groups charter before spewing nonsense... on simple demand
anyone can have his/her posts removed from the Google groups. On condition
that the person in question produce proof of his identity. Put differently,
me and Steve our posts will be deleted instantly, yours however will remain
where they are, since you post with a fake address...

>You hold nothing as soon as you posted on an open forum.

He holds a lot, this is not an open forum, this is a group belonging to
USENET, read the RFC rules and be amazed....

>I have since changed the spelling, but I won't take it down. My usenet
>guide is informative and accurate, and gives good examples where needed.

Sure it is... ;-)
While you're busy changing the "spelling", may I advice you to change a whole
damn lot in the MagiC guide also... If I would be one of the representatives
of ASH, I would demand your ISP to take the page down immediately. You not
only give false information but also manage to give false price info. That's
slander and libel both at once... Oh, and the MagiCMac "information" in the
idiots-emulators guide isn't correct either, if you really want to be taken
seriously, at least get your facts straight... the way it's now, people might
wonder who the idiot really is..

>If you don't like what's on my site, don't go there.

That's not the way the www works, if you don't want people to read certain
pages on your site, you have to protect them, with either a code or password,
The very instant you open a site on the www, it's public... read the contract
you've signed with your ISP. And unlike in usenet, owners of a site can't
slander and libel people/institutions/governments/etc, you can't hide behind
anonimity like in usenet. All it takes is one formal complaint to the ISP that
hosts the page(s) and the "gfabasic" website is history....
Interprete the above as you like, I'm not Steve, I use different methods to
get rid of "annoying things", you claim you've got brains, well, use them.

Cheers from Belgium
Dennis

In Europe, including the UK, the copyright remains with the
author, unless it is explicitly assigned to someone else. It does
not matter whether the item has been published or not. Publishing
does not make it public domain. Things may be different in the US,
but even there some films and recordings (I believe) that were
believed to be PD were found not to be.

The laws on fair use (of short extracts for purposes of review etc)
also differ in US and other countries. I haven't seen the site
complained of, so can't comment further.

Regards, /Peter/

Hi Didier,

>> http://www.ATARI-Fachmarkt.de
>
>Like eiffel, but emulation at 100% isn't possible because unused cmds
>like CONTROLLER_EXECUTE need the original processor a 6301.

According to Peter, the firmware has been updated/fixed some two months ago,
and it should be really 100% compatible now with TT and megaSTE keyboards.
I don't have this particular gizmo so can't tell you if it's just hype or
based on facts....
But IMO nothing beats a real keyboard, and these are available from various
sources for a whole lot less then what the interface costs...

Cheers from Belgium
Dennis

I didn't say "people", I said "THE MORON", that's a huge difference....

>Reason i drag Mac into discussion is that u keep blame us for using
>foreign apps.

You've dragged it in because of wrong reasons. MagiCMac was dragged in,
to make me look silly, all of a sudden everything I said and stated
wasn't valid anymore because I happen to use an emulator *some* times.
And ever since I'm the "MagiCMac" user...

>On MagicMAC u also, of nothing else, u use HFS, and open Transport,
>since Magic do not directly acces Mac ethernet or serial. (serial
>maybe?) And thats actualy no differens as ext2 or mintnet.

I've no idea what version you are discussing here, but the latest one
(MagiCMac 6.20) can access the serial ports directly, open transport
etc... is not needed, and the same thing applies to HFS, it's needed to
boot the app of course, but from then on it can directly access TOS
formatted partitions, the latest version, MagiCMac X takes the whole lot
a step further and supports the ethernet port directly also, IMO as far
as emulators go, MagiCMac X is the most advanced one, and I don't care
that Aranym is free... it's a zillion light years away.

Cheers from Belgium
Dennis

Hi Janez,

>>A MagiC user needs "stable" apps and a MiNT user needs "clean" apps in
>>order to get a stable system, what the hell in practice is the difference?
>
>Difference is that MiNT will not crash. App may crash, and since memory
>space is protected and can not be overlapped, MiNT will report crash, reg
>and BSS etc dump, clean the memory and that is...

I've experienced crashes with MiNT/N.AES 2.0 where the only possible solution
was to switch of the TT and reboot... and before you get your knickers in a
twist, I'm not blaming MiNT for this but N.AES

>If u did experience Magic "system overschreiben" error, was quite nasty with
>v4, thats what happened, some of apps did acces and put own data into area,
>where Magic was....

True and fair, but version 4.xx is from 1994, how perfect was MINT in those
days? Let's talk about the English version 6.20 dated 20.02.2003 .....

>Many apps dont obey those rules, so MiNT, if MP is enabled, dont allow those
>apps to run. Luckily for most cases, systems are both stable without MP so
>i personaly im not too excited, but is definately good feature, since OS
>prevent to run bad app, instead to run it and risk a crash. Somehow bad
>point is, that some apps realy behave kinda okay, but MP prevent them to
>runsince code is not MP aware (can overlap other app)

I didn't say it was a bad feature... but suppose you need to run a certain
app even if it means running it without MP. You'll run the risk that the app
crashes, but for the same money it'll run without taking anything down at
all, so yes it's a bit of a gamble... but when there's no alternative, what
will you and/or others do?

>Well i do prefer Thing, reasons are that Jinnee is a bit to similar to
>MacOS for my taste (taste is personal thing), dont have UnixFS support
>(must admit that last version i tired was 2.0x)

This is like the chicken and egg situation.... Jinnee was mainly developed
between 1996-1999, take a look at the Mac desktops from the same period...
all I can conclude is that Apple inc. applied some reverse engineering. But
yes, if one launches Jinnee for the very first time he'll be inclined to
think he's working on some sort of a Mac.
As for Unix fs support, try out version 2.5 and be pleasantly surprised, and
be even more surpised to hear who you have to thank for it: without Steve S.

it never would have happened...

>As i can recognize scripter as very usefull idea, i did also stated i miss
>it in Thing. On other side i got used to Thing's groups, and that feature
>also is very usefull.

It probably wouldn't be hard work to get scripter working... back then when we were translating Jinnee, Manfred Lippert mailed me a special version of Manitor to try and debug the whole lot. I set up MiNT on the TT and the clone, almost every new Jinnee beta was better and more compatible, but at long last Manfred threw in the towel, the author of Scripter didn't want to coorporate....

>Dennis, since i belong to " u and some others" lets clear some things: i
>did not cheerish alien apps, or make a fuss. My initial message was that
>there is actualy no Magix or MiNT app, just plain Atari, or let say GEM
>apps. I just added that because MiNT with acces to HUGE Unix library,
>especialy on field of internet drivers, services and so on, not huge X
>apps, is im my view way to future, from simple fact, that its alive OS, has
>acces to loads of soft and it can adopt fast to eventual new protocols or
>even new machines.

Yep....
And we have conflicting views on this issue...
But for the sake of argument, let's call the Atari apps "GEM apps" like you suggested... how on earth can be a "huge" Unix library with internet drivers, services etc be the future of this platform? To be the future would imply that the majority of the Atari users use MiNT and in addition use it mainly for acessing internet.... sorry Janez, but like I said, we have conflicting views on this issue.
IMO Joe Average wants to see new "Gem apps" appear on this platform, it doesn't really matter what kind... as long as Joe gets the impression that something is moving on this platform, he might stick to it. The fact that some extra's appear for MiNT are a bonus, but just not good enough, look around you, almost 60% of the posters here use a different platform to post to this group, the extra's for MiNT couldn't prevent it, not right now and certainly not in the future.

>Untill clones are m68k there is not big prob, IF PPC appears, MiNT can
>adopt, Magic prolly wont.

Ok.... I agree.
But let's also face facts, there are no PPC or Coldfire clones available, and even if they were available, so what? They'll face the same dilemma as the previous clones.... no software support. We've discussed this already, it's a catch 22 situation, and let's get one thing clear for discussion's sake, I don't mean a few programmers adopting their apps when talking about software support....

>Yet u emediatley cassified me into lamers, dreamers whatewer class u
>invent, also in class of lousy coders bla bla... I can only see one reason,
>i had say that i like MiNT. And that was enough for u.... U did jump on me,

>so i wont keep shut. Remeber i did NOT say that Magic sux, or that future
>of Atari is Gimp or whatewer...

I really didn't, but you identified yourself as being one of the people that was being "attacked". If I really wanna have a go at you I'll address you by personal mail, but because of the nature of usenet however whatever you or me post will fit many people.... it's like a hat, it doesn't necessarily fit you, but it will fit on the head of someone...

>Some time back i really got pissed, called u name, but u did say things i
>NEVER did say...Also i many times said good stuff bout Magic, scripter etc,
>did u EVER recognize any of my MiNT reasons?

Let's face it Janez.... this thread has been a lot of fun, and it helped us get through the long hot summer. But I think it's about time we conclude it, about everything that could possibly be said in favour for or against using a particular OS has been said, and we're just repeating ourselves... IIRC we've more or less been shouting the same thing one,two, and three years ago also. And yep, I said thing you never said. But be honest, you might not have said them here in public, but I'm convinced that you thought of them. And no, I never ever recognised one of your reasons to use MiNT, but then how could I? The last eight weeks has been like "a one against all" fight, I did get a lot of support in private mail, more then I expected really, but in here I had to do it on my own.... there have been days, that I literally wasted hours replying to numerous posts, I'm only human and have a life outside CSAST also. So yes, I probably have been unfair to you in some posts, but like I just said, this is because of the nature of usenet... and you take almost anything I write personal. If I would do the same thing then I probably wouldn't sleep anymore...

>Bout file locking. Your view is like that Mac guy, claiming there is no
>OSX viruses so noone need to check for viruses. Not to safe, and u may
>think im moron, but u do know Magic user who suffered. Me. Since Magic is
>mtasking, i was during reorganising the hdd, write some text etc, move app
>folders etc, and on exit after few hours, magic crashed, hdd was gone and i
>even had to restore MBR of hdd.... And if i warned ppl bout that, since i
>didnt say magic is crap, but that its wise to take that in mind, that are
>tales for you...

There is no 100% fail safe OS, if there was the whole business corp would jump on it immediately. Some OS's are more prone to errors then others, but I think that a lot of these errors are caused by the user... MagiC crashing on you for example could be the sum of a bad hard disk, I've known people who had a incorrect SCSI set up, and although it appeared to work correctly, in the long end it screwed up their hard disk. I'm not saying this happened to you, it's merely an example, an OS crashing on someone is usally the sum of a lot of different factors coming together... MagiC isn't perfect, I never claimed it was, I only said that it suits me for the things I use it for... and some people can't grasp this.

>So i shouldnt be happy if some app or driver, like NFS, which i personal
>really use a lot, make sharing betwen coding and test machine easy, and

>mustny say "i like NFS, it make my life easier" or i will loose Atari
>feeling? Problem u have is that u interpret that like im saying NFS is
>totaly ultra cool, Magic sux cause it dont have it, its genuine Atari app?
>In such case, please be my guest, stand on my path.

OK, I'll stand on your path ;-)

>What i want to say is: jinnee definatly used some Mac things, folder tree
>lists, spring folder, HFS support, type/creator bits support. It make life
>for u on MagicMAC easier.

Sure, but it also makes life easier for people using the real hardware, the way I see it Jinnee is a continuing story, on this platform we've always had exceptional good desktops, remember Neodesk in the early 90's?, followed by stuff like Ease and Thing? All these desktops stood far apart from stuff people on other platforms had to deal with... Jinnee is simply the last one in the line. And yep, it shares a lot of similarities with the Mac and PC desktops, but that's where the comparisation stops. It's purely personal taste of course but I wouldn't want to trade my Jinnee dektop for a 100 XP and OS X desktops put together... not to mention the Linux crap which is welcomed as the next best thing by some people....
Together with Calamus, Jinnee is about the only app that can still compete with stuff from other platforms, which is remarkable in a way because the last public release is almost three years old....

>>So I presume that everyone involved with either sparemint and/or seti
>>agrees with your views and the way you express them? LOL
>
>Nope. But u on other hand, do. I did disagree with Lonny on same topics,
>and agree on some other, and suddenly i was his buddy, etc bla bla... U
>will need to realise i am NOT Lonny, or Frederic, or they arent me and stop
>bashing all ppl into one basket.

Come on Janez, give me a break....
Remember when Lonny had a go at Derryck? The only reason being me adding the DDP signature to my posts, following his weird reasoning the other members of DDP automatically agree on anything I write here.
Well, this is irony at its very best..... he dug a hole for me and fell in it himself, I assume that everyone in his signature agrees with his views also. I was more or less forced to drop my sig from certain posts, unless he does the same thing, I'll keep attacking it.... So don't complain to me, adress Lonny and object to him using his sig under certain posts. :-)))) <very fat grin>

>>Anyway, you've got my nomination for the website of the year, but don't be
>>surprised, if it gets a contender soon....
>
>Well i must say i dont exactly agree with this page... On other hand, it
>maybe just calling horse a horse as u said. And freedom of speach. Ill
>repeat, i dont agree with guides, bit heck, it is a taste of your medicine.

It's not medicine, but a cheap placebo... tune in to CSAST the coming days, the cure for the illness is already developed, the result of it will be visible in a couple of days..... :-)))) <another very fat grin>

Cheers from Belgium
Dennis

>It still is, although you have to ignore a lot of bitterness. Steve,
>Lonny, Dennis (among others) often contribute to this group with
>information and advice. Unfortunately, the level of argumentation
>(and profanity) has been rather unpleasant of late.

I agree completely, but put yourself in my shoes for a minute... I've asked and even pleaded to Lonny to stop this continuing nonsense, and instead of being sensible he adds more oil to the fire. So it's up to me now I suppose, I either react to his ongoing provocatons or ignore them. Ignoring them would be the sensible thing to do, but unfortunately I'm only human....

>I've mentioned before that the currency of Usenet is goodwill. To
>annoy others is to risk that others will stop reading your posts, thus
>devaluing them.

That's also true, and perhaps it's also why lately I tend to help more people by private mail. Whatever I say in here, there's always bound to be someone that takes offence to it. Usenet is goodwill like you say, well my goodwill is almost gone... it's not appreciated, and receiving filth in my mailbox is about the last straw.

Cheers from Belgium
Dennis

What is the matter with you? Just because GFA is not developed and
supported anymore, it stops being? GFA IS and WILL ALWAYS be a high level
language, just as Devpac IS, and not WAS, a great low-level development
tool. PureC is not C .. it was C everyone. Goddamned......

Dennis u are mistaken here :) GFA is high level language. Simple description says the closer to human thinking language is, level is higher and the closer to machine languages, level is lower, like ASM and machine code are the lowest level. And actualy there noone realy care what level language is, product is good. Even more, lower level language has, higher level coder needs, so please lower GFA level, id be glad to be known as good or even decent low level programmer :) I think u are mixed level with generation, Basic is 2 or 3rd generation language, C etc are 4th.. and so on...

But, i dont know what u meant by that message? Coders dont exactly care what level language is, users even less, who cares what language is used, if application is good?

As others have rightfully replied, you have made your text (and email address) publicly available which makes your claim totally void. This is the same principle as the copyright on photographs: Any picture taken of you is automatically your intellectual property, *unless* it was taken while you were deliberately showing yourself to public (like in a free performance), because by that you imply that anyone is allowed to see you.

And if you don't agree with that, you might want to sue google and several other services since they automatically put any posting on websites. Good luck fighting their legal teams.

Now please go and find a hobby, you're looking more and more silly with every posting.

Maurits.

> a twist, I'm not blaming MiNT for this but N.AES

Of course. Personaly i like MiNT together with N.AES so stability etc achieved with AES is important. N.AES is better as are your impressions, and if crashes u got are infact lockups, out from blue, with only mouse working, but no kbd, no mouse buttons etc, there is a cure. Still, u got those crashes without MP on, MP is designed to prevent bad apps to crash the OS or other apps with them...

> True and fair, but version 4.xx is from 1994, how perfect was MINT in
> those days? Let's talk about the English version 6.20 dated 20.02.2003
> .....

Of course. Magoc got better, also MAGTOROM helped in v4.xx so Magic now is a lot less touchy. Still it can easily happen that one bad app (u use mostly GEM apps etc) accidentaly write on prt of mem other app already has data in.. That usualy is cause of some sudden crashes with apps we usualy think they are okay... Thay may be, just part of RAM they accesed was corrupted. MP is more cure for bad or weird apps and events as for OS itself.

I wont coment how perfect or non perfect was MiNT in those days. My mentioning v4 Magic was not commenting Magic and using old version, but it was to show wha that error message meant. Please, dont take all as threat.

> I didn't say it was a bad feature... but suppose you need to run a certain

> at all, so yes it's a bit of a gamble... but when there's no alternative,
> what will you and/or others do?

Alternatives for me/us are enable MP or make a collection of safe apps, or list of touchy ones (must admit i never did that) to know what we may or may not run. Alternatives for u/magic users are same: use safe apps, avoid bad ones or, hehe, install MiNT (in this case kernel+N.AES only, no unix part) and enable MP. For me MP is not to nice option atm, since i have CT2 and MP uses same PMMU tree as FAST ram driver for CT2 so there are some issues with that.

> This is like the chicken and egg situation.... Jinnee was mainly developed

> to think he's working on some sort of a Mac.

Well i do think that Jinnee came a tad after MacOS 7.6.x Still as mentioned, look is personal taste thing. Fact that i dont like a look etc, only means exactly that. If there are no big lack of features etc, that not affect functionality. Same as u may realy dislike look of some Magic aware app in N.AES, but functionality is still there....

> As for Unix fs support, try out version 2.5 and be pleasantly surprised,

> clone, almost every new Jinnee beta was better and more compatible, but at
> long last Manfred threw in the towel, the author of Scripter didn't want
> to coorporate....

I know, since i also tried some jinnee betas and they were better and better. 1st ones had man issues, i hated black buttons a lot etc..

Im certain implementation would be preety easy, unless there are some structural probs in code. Fact is, u should believe us, that MiNT and Magic, or both AESes arent so different. There is beuty in that, prolly there is more diferences in general MacOS updates, each new version prevent some apps to run etc... No such stuff on Ataris.

> Yep....
> And we have conflicting views on this issue...
> But for the sake of argument, let's call the Atari apps "GEM apps" like

> have conflicting views on this issue.

Thats ok with me, as long we can have such views, without spitig and so on. But for the sake of argument: i see that this way:

HUGE Unix library is infact not exactly usefull, contains big apps, complex X app for which we would need PPC etc. But it also contain many protocols, drivers etc for all sort of LANs, INET acceses, mail protocols bla bla, and what i find most usefull, any NEW protocol got drivers almost instantly. Main point, on which we are proud with MiNT is that if u are forced or wish, to change on some protocol, let say NFS, or ethernec, or latest pppd (in my country Telecom has still monopol on inet acces, and they some years ago switched to M$ and thus used their last PPP efectively killed my Sting and IConnect acces) GEM apps dont have to be changed. We just use new PPPD, or new XXX driver etc.

> IMO Joe Average wants to see new "Gem apps" appear on this platform, it

> now and certainly not in the future.

Well u need to be honest (dont see this as threat, it is a fact) and tell
that Joe, that MiNT is still in development. So this platform has OS thats
alive. Since we all have also non Ataris at home, Joe also need to know
that he can use NFS or Samba, or ethernet to put Atari in LAN and avoid
floppy net, and that there will also be new version of those drivers. MiNT
will never be able to prevent that, and reason u state, lack of apps is
definately correct. MiNT has on other hand, with those extra stuff prevent
Atari goes to closet, and it makes user to put Atari in LAN. MiNT saved me
from getting PC for cable, since i also had luck and get Riebl card quite
some time ago (5y) where was no decent ethernet (well no solution at all)
for Falcon. I finaly bought PC 6months ago, mainly because Astromoy apps
and its 3d power in that respect.

>>Untill clones are m68k there is not big prob, IF PPC appears, MiNT can
>>adopt, Magic prolly wont.
>

> it's a catch 22 situation, and let's get one thing clear for discussion's
> sake, I don't mean a few programmers adopting their apps when talking
> about software support....

Its not exaclty catch 22. Look from hardware developers perspective amd
let assume there is no OS that can be adopted and its free. Would anyon
eeven consider developiong a clone, and be forced to completely recode OS,
IF they would get permission at all? I agree there is no new machine yet,
but all projects till now and those in action, relies on fact there already
is OS and its available and expandable. We cant afford waiting for new
machine and hw developers to usable OS. That is catch 22. MiNT exteras, and
gcc, which means we can emediately use them, and use them in GEM and for
GEM is only thing that can imho cut the catch 22.

> about everything that could possibly be said in favour for or against
> using a particular OS has been said, and we're just repeating ourselves...
> IIRC we've more or less been shouting the same thing one,two, and three
> years ago also.

That is true, it going all over again. But accept a criticism and major
blame because u really, really go off too quickly. U cant expect we wont
cheerish, or be glad if some app, even if not Atari app, makes some stuff
possible. Like i said, Mintnet on TT server, PLIP, NFS etc make my life a
lot easier, mainly life WITH Atari... As im concerned, if u put anti-atari
alert on some more tolerant level, this wouldnt happen. U argue with me

about things i think nearly the same as you, merely since i like some things bout MiNT, which imho can help this platform a lot, did help me to stay, did helo quite few persons i know to stay on Ataris, even if in konjunction with some clone or PC/MAC.

> And yep, I said thing you never said. But be honest, you might not
> have said them here in public, but I'm convinced that you thought of them.

Well im affraid your convictions are wrong. I do type what i think. I do think Magic is preety neat OS and so on. And u can ask ppl, i do recomend Magic to all without sufficient HW power etc. If they have enough power, i suggest MiNT, explain why and then respect ppl's choice. Also when i, hm, tell u to "f*** off" i did at that monent think exactly that. Im not proud on that, but its true.

> And no, I never ever recognised one of your reasons to use MiNT, but then
> how could I? The last eight weeks has been like "a one against all" fight,

> but in here I had to do it on my own.... there have been days, that I
> literally wasted hours replying to numerous posts, I'm only human and have
> a life outside CSAST also.

Easily. If i wrote that imho MiNT is OS for future, i didnt wrote Magic SUX and so on. I did also write why i think so, and why i do like CLI and some CLI apps. I didnt attack either Magic users or coders etc...

> So yes, I probably have been unfair to you in some posts,
> but like I just said, this is because of the nature of usenet... and you
> take almost anything I write personal. If I would do the same thing then I
> probably wouldn't sleep anymore...

I did take them personal, since personal is not just what u say to specific person. U cant say "Hitler and the rest of Germans are nazis" and expect ppl wont take that personaly... I alread said that im not that touchy, and u may remeber that stuff that pissed me off the most, was that u didnt differ betwen porters, developers and MiNT developers (OS guys), but put all into "u bunch" basket

> There is no 100% fail safe OS, if there was the whole business corp would
> jump on it immediately. Some OS's are more prone to errors then others,
> but I think that a lot of these errors are caused by the user... MagiC

> someone is usally the sum of a lot of different factors coming together...
> MagiC isn't perfect, I never claimed it was, I only said that it suits me
> for the things I use it for... and some people can't grasp this.

Oh we do grap that, well i do atleast, and there is no problem in that. But u also need to know, that some of your argumentation sounds like this: "It serve perfectly okay to me, and i dont need any othje crap as foreign apps, or half braindead cli ..." if i say it mildy. I and i believe

others, then act on base of that. And i guess its just cause u feel, that we with prefering MiNT and its extras attack Magic. In my case thats definately not true...

> Sure, but it also makes life easier for people using the real hardware,
> the way I see it Jinnee is a continuing story, on this platform we've
> always had exceptional good desktops, remember Neodesk in the early 90's?,

> purely personal taste of course but I wouldn't want to trade my Jinnee
> dektop for a 100 XP and OS X desktops put together... not to mention the
> Linux crap which is welcomed as the next best thing by some people....

Well i agree with that completely. I would use your message to make one point, i try to explain many times. Linux is good os, i use it on PC, use KDE desktop, which also aint bad at all. I like Unix as well, its great im my eyes. Yet id NEVER install it on Atari, since all id got would be slow Linux box, and all Atari spirit defintely killed. There MiNT drop in for me, since it efectlively and very nicely blend Unix with GEM, without any cost on GEM side. Compromises are made on Unix side, on alien side, since MiNT is not Unix wannabe. One of such compromises is for example U:\ drive, since GEM apps cant understand unix pathways, so Unix path style are actualy link to U:\xxx. This prevent some things possible in Linux, but heck, who care... I hope ull find same spirit here as yours in doint want to exchange Jinnee for those OSes. Exactly same here, either MiNT (or in worst case, Magic/TOS <g>) or nothing. Must to add, thats exactly a view and path of MiNT developers...

> Together with Calamus, Jinnee is about the only app that can still compete
> with stuff from other platforms, which is remarkable in a way because the
> last public release is almost three years old....

Id prolly find some more apps.. But what remarkable for me is also a fact that Calamus will run on Magic/Jinnee, MiNT/NAES/Thing, MiNT/XAAES/Thing, Magic/Magxdesk, Geneva/XXX,<do some own combinations> as it IS. No crap and libs and OS changes as on Mac. I think Mac is ONLY computer, which came with 2 OSes preinstalled... We all know why. Calamus or almost any app we use will worok on TOS!

> Come on Janez, give me a break....
> Remember when Lonny had a go at Derryck? The only reason being me adding
> the DDP signature to my posts, following his weird reasoning the other
> members of DDP automatically agree on anything I write here.

Odd, i never had a go on Derrick. Maybe when i had a go on u and translation stuff, i did apologise later. Ill do that again now, and also said what i did once: i do know how shitty work translation is. I guess any coder do know that, esp if u have embeeded messages in code, not all in RSC. But u know why i bursted and i still think im right in that case...

> Lonny and object to him using his sig under certain posts. :-)))) <very
> fat grin>

Na, that wont pass :)

> It's not medicine, but a cheap placebo... tune in to CSAST the coming
> days, the cure for the illness is already developed, the result of it will
> be visible in a couple of days..... :-)))) <another very fat grin>

Well i will see... Im really seriously thinking on abandoning CSAS, since
i dont think this is getting anywhere else as to weakening the scene even
more. The stuff must be cutted at some point, thats exaclty the reason i
wrote those loong messages and trf to explain my thoughts detailed and
tried to be as undersatandable and fair some non english person can be.
Imho its also time u and lonny ditch battle axes, maybe eat a bit of pride
and realy try to get to bottom of the misunderstanding.... There is REALY
no matter what OS someone uses, actions and stuff is whats important. All
this crap is built arround wrong stuff, ending u and some ppl bashing Lonny
and/or his apps, or even choosen language, then he write some stupidity
back (its easy, i know, i did that), u then catch on that and overreact,
then he bash your OS... See similarities as in some holly wars, in which
friends kills each other for what?

Janez

> Repeat: DEAD DEAD DEAD

Firstly, you are now being rude and childish. Please cut it out.

Secondly, GFA didn't stop being a high level language the minute it was no longer officially supported now, did it? Would you care to explain to the reading group what happened to GFA the minute it was no longer officially supported? It turned into an ex-computer language? You can't be serious, right?

3rdly, if you paid some attention you would be aware that there are work going on to keep future support for GFA coding language going, ST-computer even wrote about it some time ago. Sure, the original company and Frank Ostrowski aren't in the picture now, but that would hardly matter.

Furthermore, why feel the need to bash a programming language that is still being used to actually code appliations?

AtarIRC is one example, quite obviously, others being Luna and also my program AtarICQ. Why you feel the need to complain about a coding language that is still being actively used in development of Atari applications even today, is beyond me and probably most ppl.

These last postings of yours really got me wondering what you actually _like_ with the Atari platform of today.

I aggre but it depends on your position in world... I like MSTE keyboard, some odd MST (with quadratic keys) even more, but i had to travel to Neuss (FAR!) to get MSTE kbd and it was damn Switzerland-German, so VERY strange... Posting then also add a little to cost etc.. Decent PS2 kbd are available everywhere and there is a lot of models, one sure is good enough...

Yes, it shows you're currently not able to handle a mature discussion
without resorting to name calling from what I can tell.

It seems like the only thing that is currently being discussed is who
is an idiot and who is not. That is not very Atari related in my
opinion, and certainly not constructive.

Recently there have been a lot of work put into the caching capabilities in HighWire,

something that has now made it possible to look into support for online graphics. As a result of this, the need for jpg/png support also has become evident and hence the appropriate libraries have been ported and added to the HighWire sources.

The experimental builds are now able to view online graphics, be it GIF, JPG or PNG, and to give you a little demonstration of this we have now uploaded 3 new screenshots to the HighWire website.

You might also notice that HighWire has been given dithering capabilities too, resulting in surprisingly nice results. Finally, you should be aware that there are no guarantees that all of the above mentioned features will be present in the next public release, although that is obviously the aim.

HighWire website: http://highwire.atari-users.net

>this newsgroup???

This _is_ an interesting question! Has anyone thought about the
possibillity to write a self spreading Internet worm on Atari OS's?

It's easy to prgram an SMTP engine but the usual buffer overflow
techniques to "inject" worm code on Intel systems seems harder to do on
m68k systems?

You need to find a spot in STinG/STiK/MintNet where data with unchecked
length gets stored on the stack and then executed, I guess.

Or maybe some client could be the victim. I do know that Popwatch suffers
from buffer owerflow problems (mail with one long single line) but to
make the program counter jump to code received in a mail is another
question...

If it is possible to write an Atari worm it would have some problems to
find other Atari computers to infect. On the other hand it could be going
on for quite some time before recognised by anyone.

An evil idea would be to first let an Atari worm spread slowly for some
time and then suddenly transform into a Windows worm spreading from a
couple of hundred infected Atari computers all over the world...

Hm... back to reality...

Hm, either there's something wrong with your threading or lp has started
to put in "noarchive: yes" in his posts. Those who can't stand up for
what they write and are afraid to be found in the archives of Google etc.
get filtered out here without further notice...

>Repeat: DEAD DEAD DEAD

Yes, you are right! Everything about Atari computers and its software is
really very much dead!

I got a phone call yesterday from the UK (the girl did speak Swedish,
though) where they wanted to know about if I happen to use or own any
computer. Very funny as I have become some sort of Atari collector
besides using it for everyday use:

Girl: Do you own a desktop computer, and which brand?

Me: I own ten and three of them are running right now. Two pc's and 8
Atari computers.

Girl: Hm, Atari a computer? Never heard of...

Girl: Do you own a laptop and which brand?

Me: Yes, an Atari Stacy.

Girl: Do you own a handheld computer?

Me: Yes, an Atari Portfolio.

Girl: Usually my system comes up with further questions at this point,
but unfortunately there are none for you...

And, she was not interested at all which operating system I use on any of
my Atari computers...

It may be just that they don't yet have an English version, so I'm
being plagued by the language barrier, but when I tried the Tempus
Word demo, I really didn't like it at all. The interface was not very
logically laid out (IMO), which made it rather difficult to use
efficiently straight away. In my opinion, simple, logical interfaces
are much better than having every feature in the program (an
exageration, of course) represented by a button at the top of the
page. Could someone tell me specifically what Tempus' advantages are
over Papyrus? I personally haven't seen all that many bugs in Papyrus
that people keep complaining about (although I have seen a few very
minor ones), and from the Tempus demo couldn't really see any
advantages, while I see lots of advantages with Papyrus - to me, it's
much better than MS Word, Apple Works, and just about any other Word
Processing program I've used. Like I said, maybe things will be better
when they get an English version made, so I can honestly see the sum
total of Tempus' features. Until then, I'm happy with Papyrus and its
simple, elegant interface.

Yes it is, with a adapter for the ACSI-Port. Unfortunatly I have
forgotten the name of the adapter (something like "the link") and I
doni¿½t know if it still is available anywhere.

Hi "Christian Potzinger"

> Is it possible to connect a Iomega ZipDrive,
> 100MB-SCSI, with an Atari 520ST? Thanks.

It is possible, you'd need something like a 'Link' and someway of providing TrmPwr to the SCSI device. One way to do this is to chain in a SCSI hard drive with the trmpwr link enabled, There are mod's available to adapt the ZIP drive to provide its own TRMPWR, maybe a google search will yield that info if someone doesn't pop along with it in a few mo's. You'll also need hard disk driver software.

I believe that it takes some skill to write something short.

Linus Torvald started out trying to write a better file system than MiNT's minix file system, and came up with the ext2 file system, now used by MiNT. And having done that, and having a masters in computer science, wherein you learn to write an operating system, he proceeded to write one that did run on something other than a m68000 family processor. There is no surprise why linux seems to work just like MiNT, but a little improved in some areas. Netscape does not run on MiNT.

I happen to like MiNT. I happen to like TOS. I happen to like Linux. This is written from a NetBSD host, using Pine. I would probably like Magic, but do not have a copy. I would probably like linux lite, if I could find a copy.

They are all good for different things. I do different things.

Jim

I ordered mine almost 2 years ago. Marked EC but is full 60MHz cool
running gorgeous 060. Did have to straighten some pins though. Certainly
doesn't qualify as complete fraud but order way ahead of time because mine
took around 30 days to arrive IIRC.

> Word or Papyrus etc, with complaints about many bugs. Protext has very
> few bugs. Though not officially supported, there is an URL where an
> updated version is available (6.xx), which I have mislaid, unfortunately.

Blimey, i spent a fortune on that and found a few bugs on them beasties, and
also had a few scraps with the authors when they expected me to pay for
upgrades that fixed the bugs i found on their behalf.

I must dig it all out and try to get some money back on them one day!

ISTR i had Protext first of all and imported its docs into Papyrus when i
got it until I'd set up all my standard letters and forms for Papyrus.

> Protext was the preferred prog for journos. The prog is still able to
> produce properly printed manuals.

I though it was Le redacture <SP> that had that honour?.

> Protext was available only for Atari, Amiga and PC, I believe.

That covers most platforms! 8~) A ZX81 version would have been a dog!.

6493. -=[WANTED: Old/Used Computer and Electronics Magazines]=-

Newsgroup: comp.sys.atari.st
Date: 2003-09-16 18:27:56 UTC
From: Sellam Ismail <sellam@vintage.org>
Message-ID: <LCI9b.366929$Oz4.143864@rwcrnsc54>
Source record: 23674

WANTED:

Old and used computer and electronics magazines, periodicals, journals, conference proceedings, etc. for a historic computing archive. Age is of no relevance.

Atari related magazines and newsletters are especially desired.

Specifically looking for the following titles currently, though this is by no means a definitive list. We are interested in ANY and ALL old or used computer or electronics magazines.

Business Computer Systems
Business Computing
Classroom Computer Learning
Communication News
Computer Decisions
Computer Design
Computer Graphics World
Computer Merchandising
Computer Reseller News
Computer Retailing
Computer Shopper
Computer Systems News
Computer Update
Computer Weekly
Computer-Aided Engineering
Computerworld
Data Communications
Datamation
DEC Professional
DEC User
Digital Technical Journal
EE Times
Electronic Engineering Times
Electronic Design
Electronic News
Electronic System Design Magazine
Federal Computer Week
Hardcopy
Hewlett-Packard Journal
Infosystems
InfoWorld
LIST
Micro Marketworld

Micro Report
Mini-Micro Systems
MIS Week
Network World
Office Administration and Automation
Office Computing Report
PC Magazine
PC Products
PC User
PC Week
Personal Workstation
Software News
Software Report
Software Retailing
Systems Integration
Systems & Software
S. Klein Computer Graphics Review
Seybold Report on Professional Computing
Unix Review
Unix World

Also seeking conference proceedings. Please call 925/294-5900 or e-mail sellam@vintage.org if you would like to clear your shelves and make way for something new :)

Thanks!

>total of Tempus' features. Until then, I'm happy with Papyrus and its
>simple, elegant interface.

Well... say, that one is happy whith the software that suits
one's needs.
I use Calamus SL most of the time, DA's Layout when needing to
create or edit vector graphics or fonts, but as Le Rï¿½dacteur
doesn't work on my system, I miss a good word processor with
excellent french thesaurus.
I only own Papyrus as a demo version, and I don't use it mainly
because of the way accented characters have to be obtained :-(
I must admit that it has very powerful features however, being
the only HTML editor on our machines, for instance (though not
perfect : some bugs in word spacing).
Tempus Word seems very promising, but I prefer not rushing when
it becomes available.

Hello,

In DoIt Falcon, R. S. describes how to adapt a PC daughterboard
soundcard to an Atari.
Unfortunately, the DB50XG is dicontinued and I couldn't find
any so far.
Do you know of a recent daughterboard that could replace this ?

Thanks,

J.-Luc

We only have two contestants this month
Steve Sweet <steve.sweet@btopenworld.com>
and Dennis Vermeire <dennis.vermeire@gmx.net>

Remember voting stops at 12.00pm on 20-09-03 just look back over the weeks and see if you can spot just who used the most swear words, was the most obnoxious or insulted the most people, this could be a close one and the first prize is a young virgin lamb with mint sauce and condom, or a box of chocolates from Belgium

6497. CT60 updating process via TOS or PC

Newsgroup: comp.sys.atari.st
Date: 2003-09-17 00:15:06 UTC
From: Carey Christenson <falcon060@adelphia.net>
Message-ID: <1063738854-365573AEicMi@adelphia.net>
Source record: 23679

Anyone with a CT60,
I have been trying for a week to get my Falcon to burn the CPLD's on my CT60. Supposedly you only need to cross pin 13 from the XILINX cable to pin 10 on the FALCON. I have the JTAG cable from XLINIX. I have the parts and I have looked at the schematics or at least the ones I thought that would help. I have soldered pin 13 from the JTAG cable side to PIN 10 on the FALCON side. Then I also soldered PIN 8 and 11 together on the FALCON side. Pin 2,3,5,4,20 and 25 on the JTAG side to PIN 2,3,5,4,20 and 25 in the same order on the FALCON side. Am I missing a pin that needs to be soldered from the JTAG cable side to the FALCON side??? The STATUS light on the XILINX cable does not light up!!!! Is this the problem??? As to why my TOS setup does not burn the CPLD's??? What would I need to do to get this to work on a TOS machine??? I have also tried to get my CPLD's burnt with a PC and ISE Webpack 5.1i SP2. But it seems to lock up my Windows XP machine at anywhere from 25 percent to 75 percent completion. Any thoughts on this at all??? I have an OPTICAL MOUSE could this be putting a strain on the power supply for that PS/2 connector??? Any thoughts or ideas would be greatly appreciated. ;-)

Thanks,
Carey C

>

Hi Adam,
"Yes" to the first part or second part of my question? :)) Been to
Laurent's page when I questioned about cost and didn't read further. Long
page but if I read correctly the Eiffel is for using an "other than" Atari
keyboard on an Atari and not for inter-changing different Atari keyboards.
Hopefully the cost (+ shipping) is economical since I don't want to
open up my Falcon keyboard (keys are starting to "stick"). Did that on
another one and had trouble re-setting those little rubber plunger pads and
lost one /:)

Thanks for the URL anyway and semper fi back at ya',
John

Each Atari fitted with an adaptor can use a PC keyboard.

> Hopefully the cost (+ shipping) is economical since I don't want to
> open up my Falcon keyboard (keys are starting to "stick"). Did that on

This would give you a "fix" for this problem.

> another one and had trouble re-setting those little rubber plunger pads and

I have cable made by schematics from rodolphe's pages and it worked 1st try. Drag the .jed file to app and wait few secs... No other experience here... BTW cable was made from scratch, there is a sweden guy which made them and they are a lot cheaper as Xilinx cables....

Hi All,
I'm very slowly discovering excess Atari gear that should have gone years ago. Some interesting, some not. Note: I have so much software (serious, some unused games), hardware, mags and manuals - if you have a particular request please Email me at the proper version of:

harry!DOT!sideras!AT!blueyonder!DOT!co!DOT!uk

I'm desperately trying to keep that address spam free, (unlike this CiX address, in which I delete Email on sight, mostly unread).

What I've found right now is:

WD1772-02-02 Floppy Disk Controller (suitable for ST to TT)
External Double Sided disk drive (Power Drive make)
ZY-Fi powered speakers pair for stereo enabled machines (eg STe)

4Mb 72-pin SIMMs times 2 -> SIMMs are unused and I think they belong to
8Mb 72-pin SIMM times 1 -> Mark Dyas. I think I nicked them B^<
If anyone knows Mark, I'll apologise and send him money.
This was my dark period... %^<

Offers for chips (and light stuff) considered postage paid.
Offers for DS drive\speakers\heavy stuff to be plus postage (method of your choice) or collect from Birmingham, England.

No reasonable offer refused, but don't be stupid about it!
I know how tight you all are B^)

Examples of software\hardware\mags hidden here are:
Didot Professional
Retouche Professional
Band-in-a-Box
Sequencer One
Poolsbuster
Secret of Monkey Island
Superbase Professional
Script
Ultrascript
Replay Professional Sound Sampler
Hawk Colibri Scanner
Magazines\ST World\ST Applications\ST Format\ST User\ (the lot)

regards
Harry

Very much so, but...

I really wonder what category I fall into who am too lazy to program
directly in GFA and use the Face Value "application builder" and add some
inline code from DevPack... :-)

Body handling: HTML body converted to readable text

Jean-Luc CECCOLI wrote in message news:...

> Well... say, that one is happy whith the software that suits
> one's needs.

This is of course true, which is why I can't understand why some
people here simply dismiss certain software as being "crap" in
general, instead of stating what does and doesn't work for them and
acknowledging that not everyone uses software for the same reasons.
What might seem like crap to one person might be a God-send to someone
else.

> I only own Papyrus as a demo version, and I don't use it mainly
> because of the way accented characters have to be obtained :-(

I can definitely see how this can be a deterent. It's not a feature I
ever make use of, being an English speaker/writer, so this is a valid
point, especially for French-speaking users.

> I must admit that it has very powerful features however, being
> the only HTML editor on our machines, for instance (though not
> perfect : some bugs in word spacing).

Yes, I've noticed. The way to solve this problem is to change most of
the
tags to
tags. What they probably should have done is only
use
when hitting "Return" after a paragraph, and
for all
other "Return" hits. Most browsers won't add extra spaces every time
they run into
, but will with every
.

> Tempus Word seems very promising, but I prefer not rushing when
> it becomes available.

I'll check it out, when the English demo is available, but I have a
feeling I won't be throwing out Papyrus anytime soon.

Thanks for your reply!

Can't say what OS you're using due to copyright? That's a new one! I
don't know how anyone can answer your question without knowing the
OS/Platform. How about this: Just reply with numbers...

Is it running on:

1. Mac
2. PC
3. Atari
4. Amiga
5. Unix-type machine
6. Other

Is it:
1. Some version of Windows
2. MacOS <=9
3. MacOS X
4. TOS-Compatible OS
5. Amiga-compatible OS
6. A Unix-type OS (Linux, etc.)
7. Other

There! No one can copyright two numbers being posted on Usenet, can
they?

The easiest way of checking a tcp/ip line is using a Ping tool. It is
built into the STinG dialer if that is what you are using.

For STiK I don't know but STiK and STinG uses different ways of handling
ICMP (like Ping) traffic so you have to select the right programs if you
are using any of these stacks.

A more general way of checking "line quality" is to put the modem into
command mode by entering three + signs, enter the appropriate command and
then switch back to data mode. This is done with a standard terminal and
might be difficult with a tcp/ip stack listening to the same serial port.

Sure! A 2.5" external case connected to an IDE adapter inside the
STf. This would be kind of expensive though, and the length of the
IDE cable might be a problem.

Alternatively, I think 2.5" SCSI drives have a 50 pin connector (I'm
not sure about this), so they could probably go into a SCSI case
without much difficulty. Then you'd just need a Link adapter.

Well, it certainly wasn't meant as a jab at you, I promise. Reliable source, was meant as a source that had a renewable supply and stock and what have you, as in a dealer. I'm quite certain your 060 was in excellent condition and I would have been most happy to have owned it, but as lp pointed out, I wanted to check to see if there was a dealer/refurbisher/etc out there, as I hadn't had much luck finding used 060s.

Again, sorry that you took it that way, but it wasn't intended as an insult.

When it's PPP we're talking about, you can also use PPP echo requests, which are meant for exactly this purpose. Not sure which of the Atari's PPP-layers support it though. (Well they should all be able to respond to PPP echo requests from the ISP since some ISP's use them as well and will disconnect you if you don't reply).

Maurits.

Hi Maurits,
How does that give the line condition? It would show the time it takes
for the signal to return which could also depend on how fast the ISP
resonds.

John
P.S. To All:
Since Maurits is a humble kinda' person I thought I'd mention that he
translated the bulk of Ballerburg2 (on Chapelie) !!!

No it doesn't measure time at all, which wouldn't be useful anyway. The
echo request is at PPP level, which means that it is answered directly
by the PPP peer so it will always come immediately (there is nothing
between you and the peer but a direct modem connection). But it checks
whether the link is still alive, which is what I thought you wanted to know.

A PPP echo request contains a magic number, and all the other side has
to do is send an echo reply with the same magic number. If you send
several echo requests and get them all back correctly, you can assume
the line is ok. If some of them arrive incorrectly, you have a bad line.
If none returns at all, the line is dead.

Since the echo requests are in the PPP-level itself, it is unaffected by
any tcp/ip error corrections or retries, only the modem error correction
(which is considered part of the line itself), so it does actually check
the line quality.

Maurits.

If you don't get the Eiffel, I can recommend a set of replacement
rubber cups, called TT Keys, from Best Electronics. These are
'stiffer' or 'springier' than the original ST keyboard and give it
a completely different touch. I've just upgraded my Falcon, and am
amazed at the difference. Well worth the US $21.95 + p&p.

The trick while replacing these cups is to balance the keyboard
ends on two thick books, so that none of the keys are depressed
when you undo the 30-odd screws. Make sure you put them all back,
too! While you have the PCB off, check the soldering of the mouse
and joystick connectors - this often works loose and a touch of
solder on each contact is a useful precaution/remedy.

Here we go again. How many millions of flames, rants and incoherent crap postings will this attract? Place your bets now. Winners will receive a free straight jacket and voucher for a lobotomy at the hospital of your choice.

Tom

I don't suppose it's worth suggesting that it might just be a matter of taste, and nothing to do with printed specifications at all? Considering that this argument has been going on for close to two decades, with no clear conclusion, I think it would be reasonable to assume they're equally matched anyway.

Hi

Damn! Just deleted a folder full of pics from the
digital camera, unfortunately I have wiped the card
too!

Diamond Edge 2.53 (Undelete function) doesn't
recognise the boot sector for the partition (J:) it is
2Gb in size with a VFAT setting for Magic.

Does anyone know of a utility to bring them back
again?

Thanx

Neil :-(

There is a clear conclusion, I've had both and at the same time... the ST
loses in every comparison except MIDI connectivity.

Agreed..the ST was an Amiga with all the cool stuff taken out.

Having said that, I don"t think this flame/thread will go very far.... it
may have been a hot topic in 1990 but in 2003, no-one cares.

With HDDRIVER there is no limit to the hard disk capacity with the Link
2. You can try the demo version on
http://www.seimet.de/hddriver_english.html.

> again?

You can do it with a disk editor.

First, backup all your tahat from that partition. (for security)

Then, launch disk editor and search for the short name of the directory you deleted, but without first character, ie. if the name of the directory was "Pictures", search for "ictures" case does matter here! Remember to search whole disk and not only one disk sector.

Once you'll find it, you'll see that first letter is overwriten, just change it again to normal letter ('P' in this example) and the folder should appear again.

You will have to do the same with the files in the directory. Good thing is that filenames of those files should be in one (or more, but following) sector, so you have to find the first one, and you should have them all.

You should only look for the "short" names of the files, like "PICTUE~1.JPG", they should be all uppercase.

Bringing back long names is much more complicated and I never did it or tried it.

This is not sufficient. If a file was deleted you will also have to
re-create the FAT links for this file. Otherwise the sectors previously
used by this file will be overwritten. The result is that the file entry
is visible but the data are data from other files.
Disk tools like DISKUS can do this for you, even though DISKUS does not
preserve the long name. But this is not a problem, because you can just
rename the file and give it a long name again after you have restored it.

What's all the fuss over these expose cards? I was under the impression
that all they were was a fairly low quality video digitizer card. Like
sub 640x480? I guess good for the Atari purist but nothing on hauppage
wintv or the mini-dv video I am now working with. Anyone have any specs on
the expose, am I wrong?

Correct me if I'm wrong but isn't that so that HDDriver alone isn't
enough. PlainTOS can't cope with large partitions. One need FreeMiNT or
MagiC aswell. Correct?

Hi All,
I see this as Atari related since I'm being indirectly affected and many here in this NG log in with PCs.
According to my ISP a new strain of E-mail virus is out there! My mailbox just started getting bombarded with MS attachments. Evidently I may be on someone's mailing list (maby from this NG) and may they be infected.
This virus is said to overide virus scanners.
It was suggested by my ISP (if I had a PC) to go to Trend.com and click on Virus advisory for an anti-virus measure.

I can check the link to see if it is still "complete" by checking mail
or a URL. What I was more concerned with was the quality of the connection
(line noise, etc.) in regards to the time it takes to download or transmit
a file. I can get modem data through a terminal program(after disconnecting)
and see that line condition varies which effects the maximum transfer rate
but it would be nice to know during the connecting process (or ideally
ahead of time) so I can abort and then re-connect with the chance of
getting a better node or a line with less crosstalk, etc.

>A PPP echo request contains a magic number, and all the other side has

when you say PPP level are you referring to ping? if so, Sting has that
feature but Stik (which I use) doesn't. Don't know about IConnect.

Yes, this is the worst virus attack I have seen here sofar. I get around
80-100 mails/hour at appr. 150 KByte each right now. Will fill up most
mailboxes quite fast!

If lots of people get this much the whole mail system must really have
severe difficulties. I suspect a lot of legitime mails bounces because
mail boxes are full.

Fortunately Popwatch can delete mail direct on the server without
downloading first. Very handy. Unfortunately the kill filter is a bit to
simple to be able to automate the process.

Right now I feel very happy as I am not a Outlook Express user where all
mail must be downloaded before it can be deleted. 10-15 MByte mail per
hour is quite a lot even for an 500 kbit ADSL line...

Perhaps the new French MEG.PRG is up to the task?

Would be ideal with a function where you search a mail for attachments
with MIME description "x-midi" for an .EXE file... A bit complicated.

6557. Papyrus query

Newsgroup: comp.sys.atari.st
Date: 2003-09-19 18:04:03 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <bkfgej$g0r$1@thorium.cix.co.uk>
Source record: 23638

Is it possible to use Papyrus in overwrite mode? The default is insert, but I can't find anythig to change this - and yes, I have looked through the manual, though only briefly.

If this is not possible, then it is a major shortcoming IMO.

Regards, /Peter/

After having my Atari TT on display on two Amiga shows here in Gothenburg
I have to agree. Especially the newer powerful "Amiga clones" are really
nice.

There website is at http://amigbg.com/ and if you look at the image
gallery you will actually find my TT with a LCD screen and extra tower on
display. There is also a Pocket PC running CastCE showing the Atari
desktop among all kinds of Amiga computers.

Also the Amiga people are very nice, friendly and interested in what has
happen to there former Atari enemies...

Well, I look at it this way: Any modern PC/Mac can do what Wintv and
Mini-DV can do. That's old hat these days, and pretty boring, really.
But to do something similar on a 10-year-old or more Atari, even if
it's lower res? That's fun and exciting (IMO)! I'm impressed that we
can do any of that sort of thing at all. It's all about having fun
with your machine.

> mailboxes quite fast!

I'm getting exactly the same here. Looking at the mail headers it references attbi.com and comcast and wanadoo.fr.

I know who the people are who use these addresses in here and I'm absolutely certain it's *not* originating from them, but somehow these spam attacks have latched on to these people's addresses.

I'm telnetting in nowadays and I'm trying to organise use of CiX's Brightmail filters to make this go away, but it explains the UK Gov'ts announcement of intended action against spam (and brightmail's commentary on it) if the volumes are as ridiculous as this.

Luckily I don't pick up mail with Outlook, so chances of infection are zero.

regards
Harry

I only have an old version here, but doesn't it switch to overwrite mode
when you press the INSERT key? It's a toggle, isn't it?

Hi All

Adam: can you recommend a disk editor? I haven't one
at all!

Also the Compact Flash card seems to have the deleted
files still on it, I found this by using the DISKUS
demo provided with HDDRIVER. BUT I am uncertain
whether this DEMO version can undelete files because
of a lack of knowledge of GERMAN!

Uwe: Does the DEMO version of DISKUS undelete files?
Or do I have to buy the full package AND spend the
rest of my time looking up words in my German
dictionary? If so, can you direct me where to find
this function?

Thanks

Neil :-)

Source record: 23546

Hi All

Along with having to retrieve deleted files on VFAT&Compact Flash cards, I now also have another problem!

My Freeserve email mailbox has been filled up with 130 or so emails from "Microsoft Security Updates" each of around 150Kb! Using Emailer I can't seem to clear the cretins from my mailbox...

Emailer normally lists the files so you can choose which to download and/or delete from server. But because there are so many unwanted ones - by the time I get down to the bottom of the list clicking out the "download" crosses and then click OK - Emailer reports "communications error" ie mail server given up on me!

HELP how the heck can I get rid of preferably everything in my ISP Mailbox? Is there somewhere to go/some Iconnect or STiNG utility/or mail someone (who?) at Freeserve?

Please answer here, as I may not pickup an email ever again!!!

Regards

Neil :-(

My 30 MB mailbox has been quickly filled up with at least 180 of the
same "updates" too :-(

> I get down to the bottom of the list clicking out the
> "download" crosses and then click OK - Emailer reports
> "communications error" ie mail server given up on me!

The timeout on the server side may be too short in the particuliar case.
It's very short on my server too.

> HELP how the heck can I get rid of preferably
> everything in my ISP Mailbox? Is there somewhere to
> go/some Iconnect or STiNG utility/or mail someone
> (who?) at Freeserve?

I was able to empty the mailbox using POPWatch under STinG. I had a
quick look to find the only interesting message in this batch, retreived
it, then erased all other messages. Hope I didn't erase a valid message.

If this doesn't help, you may try connecting to your mailbox with a
telnet client. But I do not recall the exact commands to be sent to the
server.

Bye,
/Pascal/

The technology to convert NTSC to RGB hasn't really changed much,
least not for under 3k. Unless your using a DV source, your input
signal (NTSC/PAL-VCR-camcorder) is only 320*240 anyway, and the
capture device (or software in some setups) just doubles the frame
size to get 640*480 (degrades it in most cases). The cost factor
pretty much determines the quality here. If you take video captured
with Expose, run it side by side with a clip captured with consumer
capture devices for the PC (at 320*240), it's the same data, same
picture. You could get the same frame size by doubling the Expose
captured clip, and it would look the same as the PC stuff. However on
an SC1224 (or TV/VCR) it is full screen capture:)
The big deal is speed. On a Falcon 040, the Expose can muster about
12fps at 320*240. Most PC devices are faster, but use some form of
hardware compression on the video to get 30fps (or whatever your
flavor is). Depending on the PC (bus speed, video memory, hard disk,
ect) playback quality can be anywhere from owooooo, ahhhhhh, to WTF.
Compression=bad thing for quality or slow PC.
Falcon Tripod allows capture of stills somewhere around 1024*768 by
doing some Doug Little tricks. Quality is pretty good, at least as
good as stills from my ATI All in Wonder 128, and Dazzle Hollywood
Bridge using a composite input.

The CT060 might allow capture rates up to about 15fps, not bad for uncompressed video. Somebody here could surely do the math for a better guess. The Expose captures to memory, can't use VM or direct to disk recording, so 512mb on the CT060 will be nice, and faster alternate ram should speed up the save as well. A fast IDE drive has no problem keeping up with the uncompressed file during playback. If you like Apex Media, you'll like the Expose. If you have something >2.5Gig P4, bricks of memory, fast bus, big video card, the Expose might seem like a toy. At least until you find you can't record copyguarded material:)
I use an Aiwa dual standard VCR with my two PAL Expose units, and a JVC SVHS on the NTSC unit. It's fun, quality is great. A neat tool for the Falcon.

That's one way but hopefully the anti-virus patch at Trend.com works
and enough people download it! Ideally it should be done at the ISP mail
server!

For any one running windoze. The virus...
http://vil.nai.com/vil/content/v_100662.htm
...is a bugger. Sad as well. Could have been done 5 years ago. Are modern programmers really that incompetent?

The vulnerability...
http://www.microsoft.com/technet/treeview/default.asp?
url=/technet/security/bulletin/MS01-020.asp
...which if anyone wants a quick translation of M$babble boils down to a simple sentence: "if you ain't already got this patch in place you're infected as of today".

Steve,
I also got well over 600 of these friggin e-mails.
I have a 50 meg e-mail account and it bottomed that
out like nothing even though I was erasing the
messages every 3 to 4 hours tonigh. I got warnings
that my e-mail was up to 70 percent full!!!! PLEASE
WINDOZE people get your computer FIXED. UPDATE and
run a damn Anti-Virus constantly. Your not only
hurting everyone using a PC. But your KILLING people
on other platforms that have dial up in countries
where you have to pay for your internet time!!!!

Thanks,
Carey C.

6577. CT60 problems solved!!!!!!

Newsgroup: comp.sys.atari.st
Date: 2003-09-20 03:07:31 UTC

Message-ID: <1064008318-813590AEicMi@adelphia.net>
Source record: 23559

Everyone,
I finally got my CT60 running!!!!! My friend was
using a OPTICAL MOUSE which I believe on the PC was
causing a slight fluctuation in the power threw the
JTAG cable which made it unstable to burn the CPLD's.
But after getting it burnt. I immediatly ran home
like a kid on christmas morning. I had several
crashes at first and finally got the AUTO folder
sorted so that the CT60 would boot. MAN is that BABY
FAST!!!!! :-) From wednesday till today I would have
several SPURIOUS INTERRUPT crashes. Not sure what
that means but I am running the FULL 68060 at 60 mhz.
clocked at a stock 66.6666 from R.Czuba. So I noticed
my temperature staying at a consistent 30 Celsius and
my computer seemed to lock up at least every 20
minutes with this setup. I said what the HELL I will
clock it at 72 mhz. After doing that I have been
running my CT60 for a good 3 hours without one single
problem. Has anyone else had this kind of issue with
the CT60??? I cannot believe that simply clocking it
up HIGHER made all the problems go away. Matter of
fact temperature still runs at a consistent 29 to 31
celsius, which was where it ran before. Emailer also
gave me several problems and almost always locked up
my computer and not it is also running quite
solidly!!! Any thoughts on this guys???

Thanks,
Carey Christenson

Hi Neil,
I use Newsie! Choose "Get Selected Mail". That will give a full list
of Subject and Sender. Click on "Delete All". Closing the window will
delete all on the server or you can individually select delete or
retrieve. Or call your ISP if they have support at Feeserve. Be prepared
to continually do this untill a "real" anti-virus patch becomes more in
use or the ISPs wake up and take action!

Hi steve,
I seem to remember someone (now who could that be?) stating he uses his
real address 'cause it's no bother to keep up with a few 200k exe mails :))
I've bounced back and forth between real and adjusted reply addresses.
Wonder if it makes any difference in this virus case?

John

Hi Carey,
From what my ISP said (not that they are always accurate!), this virus
bypasses scanners used to date. However said, most ant-virus programs are
useless in this case (except for those with the new antivirus patch).
But your right in the sense that most don't bother to scan anyway!

John

Ok I do a gest here....

Yes a TT60 is possible to design...not difficult at all.

But how many people want to buy ???? And who will modify the TOS 3.06 to
run on 060 ???

I don't think Didier will !
So who ???
If you solve this problem... you can request around atari world..... to see
ahow many people are ready to pay 350 EUR for a board with same features
(except the TT mb will not be boosted !).

I already did that 2 years ago (more !) and I had only 25 people !!!
So, now how could it be better ???

They indeed don't bother to scan anyway also they use a very insecure
mailer. If people would drop Outlook things would looks much better.
These virusses makes use of the security holes provided by Microsoft.
I wonder if one couldn't sue Microsoft for the damaged they cause everyday.

First I had a FULL 68060/50 running at 66Mhz with a temperature of 47 (!) degrees.
Then I changed the cpu to a FULL 68060/60 running at 66Mhz with a temperature of 32 degrees. Today my cpu is running at only 60Mhz ;-) but the temperature is still 32 degrees (I removed the fan).

>gave me several problems and almost always locked up
>my computer and not it is also running quite
>solidly!!! Any thoughts on this guys???

Well. What operating system do you use? I have MiNT 1.15 and sometimes my computer freezes. Didier suggested that it might be N.AES.

Anyway these freezes only happen every two or three days. Very strange.

From reports in other newsgroups, by people who've changed addresses
since this deluge started, it looks to be actively harvesting both From:
and Reply-To: addresses from Usenet.

>Right now I feel very happy as I am not a Outlook Express user where all
>mail must be downloaded before it can be deleted. 10-15 MByte mail per
>hour is quite a lot even for an 500 kbit ADSL line...

I know that feeling :(I've received over 1000 of the things in the past
24 hours, and these are those that weren't rejected due to other
filters.

>Perhaps the new French MEG.PRG is up to the task?
>
>Would be ideal with a function where you search a mail for attachments
>with MIME description "x-midi" for an .EXE file... A bit complicated.

Or you could try filtering on a case-sensitive FROM:/TO:/SUBJECT: header
instead of the usual From:/To:/Subject:

Personally, a few doesn't make a bit of difference, a few hundred starts
to get annoying and a few thousand results in several temporary domain
blocks being locally implemented.

> I've bounced back and forth between real and adjusted reply addresses.

Hi Harry!

No, I fear not in Pap :-(

BTW, re your previous message, I too have been getting this massive
spam attack. I logged onto Cix and found some 600-odd mails listed. I
aborted the transfer and asked Cix's help-line to delete them all,
with the exception of four that I could see I wanted. This they did,
and I got the four next blink - BUT there were another 273 in the list
totalling 24 MB!!!, so I aborted the download again after a short
while - luckily I got the 'wanted' 4 first, berfore aborting.

Typical entries were:
mzurc 594737 . Sat Sep 20 00:27 2003. == No Subject ==
mzurc 594644 . Sat Sep 20 00:25 2003. == No Subject ==
xikmkctjbbxhxo 594635 . Sat Sep 20 00:25 2003. Last Critical Update
tangjar 594489 . Sat Sep 20 00:23 2003. == No Subject ==
tangjar 594430 . Sat Sep 20 00:22 2003. == No Subject ==
dkgar 594262 . Sat Sep 20 00:20 2003. == No Subject ==
djv125 594151 . Sat Sep 20 00:18 2003. == No Subject ==
aramirez 594104 . Sat Sep 20 00:18 2003. {Virus?} new critical update

and most of the rest had No Subject as well. I'll have to ask Cix
to delete them again :-(Wonder how long this will go on for?

Regards, /Peter/

And confirmed by experimentation. Just 35 mins between posting with a
couple of tagged Reply-To: addresses and those addresses receiving the
first copies of the virus.

>But your right in the sense that most don't bother to scan anyway!

They are certainly useless on an Atari :-) But we still get the spam -
I have just had another batch. Nearly all have just a name, without a
point or '@' as the sender, and the vast majority have '== No subject =='
as subject.

My History file reports:

You have 1293 mail message(s) in your in-basket.
There are 420 unread mail message(s).

When I tried to list them for deletion with FILE READ ALL, I got:

You have reached the maximum size of your scratchpad

and after listing the first 365 CixRead crashed out. Luckily it
downloaded the usenet and conferencing message first.

I have now asked Cix's help line to delete all mail messages. As I
don't have a complete list, this may wipe out some genuine mail.
So if anyone in this group has mailed me since Friday afternoon,
PLEASE RESEND - hopefully the pest will die down.

Regards, /Peter/

I don't mean to in any way suggest that we *SHOULD* have to do this, or that it's not the responsibility of those who are targeted to keep their machines clean, but there are tools we can use to help reduce the impact of e-mail worm floods on us personally. After receiving hundreds of these messages, I started looking, and found a tool that'll log onto a POP server and delete messages based on information in their headers, without downloading the full messages:

http://mailfilter.sourceforge.net

This is intended primarily for Unix-like systems, but the documentation includes information on running it in Windows. I don't know how hard it would be to get it running on an Atari ST.

I've only had this running (on a Linux box) for an hour or so, and I'm still tuning the rules. So far it's deleting about half the W32/Swen.A worms based on matches to common From: and To: headers, but I'm sure I can improve that. If anybody's interested, post or e-mail me and I'll post the rules I'm using, once I fine-tune them a bit.

I've heard of similar tools for Windows, but I don't know if there's anything ST-specific to do this job.

No, I coded it to be mainly a spam-killer, on several mailboxes.
The check function is there bacause I'm always on the internet
with ADSL connection on my Falcon.

I have swen-spams in my mailboxes and there are automaticaly deleted
on my ISP server with the rule [size > 128 Kb].
You can use the rules you want : juste open the 'Filter' window with
the menu (or ^K) and add a filter.
Do not forget to save all the changes with ^S

> And I thought I was the only one...

Nope. I've been getting these recently as well. They've been completely blocking up my ISP's alotted e-mail capacity. One thing I discovered is that they are coming from someone harvesting e-mail addresses from *this* newsgroup (at least in my case). I use a domain forwarding service, which allows me to set up my own domain name for really cheap, and forward customized e-mail addresses and web URL's to any other e-mail address and URL's I want. I had heard that people harvest e-mail addresses from newgroups, so to test this, I set up "mail@freeman-studio.com" as the address I use only for newsgroups and had it point to my "real" account, and I've only posted to comp.sys.atari.st. This has been the e-mail address spam has recently come in through, including these "Security Updates". So as a temporary solution until I can figure out a better way to stop these, I've pointed my "mail@freeman-studio.com" address to a bogus address that I'm pretty sure probably doesn't exist (something like "mail@asdfjkl1234567890.org"). This has effectively stopped the problem. Unfortunately, this means that you can't reply to my posts via e-mail until I get the problem resolved.

One way I've been using to clear out these e-mails is to use my ISP's web-based e-mail client. It allows you to go through and move the ones you want into a "safe" folder, click on "Delete All", then move the ones you want back into the Inbox. You can then download them through your mail client of choice. If your ISP has this feature, and you have a Mac or PC (I haven't had success getting my Atari browser to get into mine), this would be another option.

Hello,

Is there another daughterboard soundcard that can be connected
to an Atari, as shown in Robert S.'s Doit archive ?
The DB50XG is discontinued, and I couldn't find a replacement
so far :-(

Thanks,

J.-Luc

6600. Meg to filter the SWEN virus and how to save data?

Newsgroup: comp.sys.atari.st
Date: 2003-09-20 20:27:19 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3f6cc6281e519f0@tripnet.se>
Source record: 23580

I have tested the Meg 1.1 antispam program to filter out all these annoying SWEN viruses that tend to fill my mailbox very quick. Does seem to work quite nice but:

How on earth do I save mailbox and filter settings?? When I click on "Save" there are no files added to the MEG folder or the DATAS folder inside. When restarted everything is lost...

I'm running Magic/Jinnee without using the HOME directory.

I can save "Preferences" into the.INF file.

To filter out the SWEN virus I simply use the "body check" for "Content-Type: audio/x-wav" in one of the virus versions.

In another version I simply check for the line "September 2003, Cumulative Patch" but it would be nice to be able to check for a longer line to avoid errors.

Also I really would like a toggle on/off for case sensivity. When trying to filter out this virus the longer the search pattern and only exact match the less risk of deleteing wanted mails by misstake.

I'm not familiar with mailfilter but can it filter on more than the header?
If so, then you could trigger it on the mime preamble.

> I've heard of similar tools for Windows, but I don't know if there's
> anything ST-specific to do this job.

It can be done manually. By now there may be someone desperate enough to do
it this way so here's a hint...

```
$ telnet pop.ntlworld.com 110
Trying 62.253.162.52...
Connected to pop.ntlworld.com.
Escape character is '^]'.
+OK InterMail POP3 server ready.
user <username>
+OK please send PASS command
pass <password>
+OK <username> is welcome here
list
+OK 2 messages
1 23238
2 4977
.

dele
-ERR message number required, e.g. DELE 1.
quit
+OK <username> InterMail POP3 server signing off.
Connection closed by foreign host.
```

...replacing <username> and <password> appropriately (you have to type the
preceeding "user " and "pass " btw). I didn't delete the message above. It
would have been "dele <message number>" (ie dele 1) but note that it won't
take effect until you "quit". ie: if you screw up just break the connection
ungracefully and the mail will still be there next time.

Oh, also useful is "top <message number> <lines>". eg: "top 1 20" will show
the first 20 lines of message 1 in raw text.

The virus will be a lot bigger than 23238 btw (145,000 -> 160,000).

Not quite as much here, but close...

> When I tried to list them for deletion with FILE READ ALL, I got:
> You have reached the maximum size of your scratchpad
> and after listing the first 365 CixRead crashed out. Luckily it
> downloaded the usenet and conferencing message first.
Arghhh! Don't do this! It files all those mails into your scratchpad an dyou
have a 2Mb normal limit.

Instead, go into Cixcomm's setup menu, Select Online tasks and turn off
collecting mail and also stay online at the end of the script.

Do a blink in this way and at the end type 'mail' to get into your mail
directory, so the messages enter your history.log file. Type quit to exit
mail, then chose the menu option to logoff cleanly. The history log is only
a text file and isn't limited in the same way as FILE READ ALL.

Check your history log and list the messages you want. Do another blink
without checking conf messages, go into mail again, type 'file <msg-no>' for
each of the individual messages you want (return after each msg-no). Type
'CLEAR IN QUICK CLEAR OUT QUICK', then type 'quit' then 'download' and after
that logoff cleanly again.

This will let you grab all messages you want unless you've been unfortunate
enough to get a legitimate message in the meantime.

> I have now asked Cix's help line to delete all mail messages. As I
> don't have a complete list, this may wipe out some genuine mail.
> So if anyone in this group has mailed me since Friday afternoon,
> PLEASE RESEND - hopefully the pest will die down.
You'd have mail from me (No, I don't have Atari CD's), but I suspect someone

has trawled this whole newsgroup for our addresses. This won't get better - only worse B^<<

Continued in cix:atari.st

There's relatively few people here. Imagine the bandwidth that's getting used up across the entire internet. I guess we're all getting 150k email messages at the rate of one per minute. For every million people, that's 9,000Gb per hour. How many million could be affected? How much bandwidth servicing it?

I've just picked up 53Mb of spam in a day - lucky I switched to an unmetered account last month (though still dialup, so it was a 3 hour download).

I'm not kidding when I say Security Services of every country should be involved in cutting this off at source. I can tell from port scans I get we're looking at the US, Ukraine, Holland, China...

Bonsoir Kenneth :)

>How on earth do I save mailbox and filter settings?? When I click on
>"Save" there are no files added to the MEG folder or the DATAS folder
>inside. When restarted everything is lost...

There are 2 types of savings in Meg:
- in the preferences, with the button
- in the menu, Tables -> Save, that save the little databases, if they
have been modified (you can also do it with ^S).
Please set also the folder for theses tables in the preferences
(DATA FOLDER) -> paths to load the files at next launch.

Hm, when I selected the menu entry "Tables" - "Save" nothing happend. But
with keyboard ^S it worked when I tried later on.

This is really a very important program for me just now to keep my
mailbox usable by deleting most SWEN virus mails. Thanks!

However my initial filters did not work. It seems I cant search for the
MIME content type in attachments (audio/x-midi or audio/x-wave) by using
the body function.

I have now tried the three body filters:

"<iframe src=3D"cid:"
"<iframe src="cid:"
", Cumulative Patch" update whi"

They seem to cover most sofar but is not at all ideal. I really don't
want to filter just on size as I often get valid emails with attachments.

Merci :)

>However my initial filters did not work. It seems I cant search for the
>MIME content type in attachments (audio/x-midi or audio/x-wave) by using
>the body function.

Maybe you can scan more lines in the body (set it in the preferences).
But remember, the more line you scan, the slower you get ;)

>They seem to cover most sofar but is not at all ideal. I really don't
>want to filter just on size as I often get valid emails with attachments.

Remember that all the mails coming from "Friends" in Meg's table are
accepted, and no filter are applied on them.

The name/email/nick from friend may not be well contructed, it's
simply a character string search (indexOf(), INSTR()). So you can
create a friend with "@atari.org" only (in email field), and
all mails coming from atari.org will be accepted.

It's not that big a deal, even now. Yesterday was a completely different
matter. When I first connected, I spent over three hours downloading
them before tweaking filters[0] and dropping domains. Now I'm seeing far
less attempts to deliver them, and almost all of them are being dropped
due to being caught by the filters.

>Looks like some kind of loop is occurring with that harvest program and
>may not even be a virus (unless that IS the virus)!

The virus connects to the infected users news server and harvests
addresses from recent posts available there[1], as well as searching
through various files used by news and/or mail readers.

Try adding "nospam" or "delete" into the address. According the to
anti-virus websites, the virus doesn't harvest addresses containing
these words.

6612. A boycott Outlook Express campain

Newsgroup: comp.sys.atari.st
Date: 2003-09-20 23:12:20 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3f6cecd23c86890@tripnet.se>

Because I got so angry from all these SWEN virus mails comming from infected Windows users I came up with the idea tonight to boycott Outlook Express users by exploiting an old bug in that program.

It works both with Outlook Express and Outlook for mail and news and it's only a matter of putting the letters "begin " at the beginning of a line. Everything below that line will not be displayed at all when you try to read the message.

I seem to remember that Newsie also suffers from this bug and that is a pity. Perhaps it can be avoided in some way??

Anyway, another guy jumped on the idea and created http://ichimusai.org/oe/ which is a good description of why you should not use Outlook or OE.

If lots of people would do this and make the OE users complain to Microsoft, then they will hopefully fix this bug.

As a side effect more users would go to WindowsUpdate and fix there old buggy OE installations and less SWEN viruses would spread because of un patched OE versions.

I actually meant to sell them on, istr I've about 3 version with manuals,
they'd be the only one's i could sell, the others were upgrades.

We seem to always miss something when we get onto this subject, its the
people exploiting the software holes that need stuffing, not the poor
barstard that's getting exploited. It may be an MS product on the receiving
end but the problem is caused by the virus writers.

> As a side effect more users would go to WindowsUpdate and fix there old

The vast majority of the peops i speak to in Windows bases are patched up,
it only takes a handful to bring a chain of servers to their knees.

No (or if it can, it's not obvious from my quick reading of the
documentation); it's strictly a header-based tool. I've currently got 18
rules that seem to be nabbing 95%+ of the Swen.A worms, though. If
anybody's interested, I can post or e-mail the rules I'm using.

Dubious that we'll ever get completely out of this argument, but hell, I haven't had a chance to articulate my end in a long time, so why not?

I've been a Mac user and PC user since I was knee-high to a grasshopper. At that point, the argument was an entirely different one - DOS was not a pretty child. Even so, it had far better support for non-LAN protocol, due in large part to the licensing requirements for supporting a very wide range of hardware and software. I used PCs exclusively to dial into BBSes in the late 80s, more often than Macs to print, and to play most games. Macs, on the other hand, I used for all graphical applications (I was unfortunately not one who was able to afford an Amiga or an SGI when they came out). I still remember the first time I saw Photoshop on a Mac - THAT was a beautiful thing. Today I have a houseful and an office full of Macs, Windows machines, and *NIX boxes, each of which I use for different things and to varying degrees - I use *NIX for all server needs, Windows for games, most 3D-oriented apps, and some software that is not released for the Mac, and the Mac for everything else.

Add to that the fact that I'm an interface freak, and the Mac was - and still is - my platform of choice. Windows took a long time to come anywhere near the Mac in terms of interface design, again, due in large part to the demands of licensing. What they lacked in GUI design, however, they more than made up for in business acumen and marketing talent, while Apple was stumbling around doing weird things with clones and target markets and interoperability.

The history of both, IMHO, has a lot to do with their respective platform advantages. Windows, needing to license freely, has much better driver, device, often networking, and 3D capabilities, even while those capabilities DO take much more work to figure out (plug and play my arse. but what do you expect when you have to support 60 printers??). Apple maintains control over almost every component and license, to the point of distraction at times. On the plus side this allows them to focus on supporting fewer third-party devices and lets them focus on OS functionality and chip integration, on the minus side...well, on the minus side it allows them to focus on supporting fewer third-party devices.

At this point, 90% of software that is equivalent in version on both platforms is at least 90% comparable in functionality. Most is not equivalent in attractiveness or necessarily usability, on the other hand. Quite frankly, the thing that kills most graphics applications

for me on both *NIX and Windows is the mouse tracking. Mouse tracking in Windows is far, far less accurate than that on a Mac, although it has gotten better. But my carpal tunnels just can't take having to use a death grip on the mouse or Wacom pen just to be as accurate as I can on a Mac.

The 3D support on a Windows machine is undeniably better. OpenGL is getting closer, and it shows a ton of promise, but right now DirectX kicks its butt in both functionality and in user base - even as a Mac fan I just can't deny that. The Mac isn't going to get the majority of great games and 3D apps until it implements DirectX, even if OpenGL gets *better* than DirectX, simply because the porting effort and market share kill it for most game developers. Let alone the video card and other device support.

The security argument is a useless one - it's like nature vs. nurture. People have spent far less time investigating flaws on Macs due to the small market share, so even just the available knowledge is much smaller. At this point we only can say that Windows certainly has demonstrated some pretty dumb holes, but that a lot of those holes have been found simply because Windows machines are so much more popular.

The Mac does a few things extremely well. I am still far more capable of dealing with different kinds of files than Windows users. In many ways with both OS 9 and X, I have a finer level of control over my machine than I do on Windows, although it IS usually like pulling teeth to figure that out. The level of abstraction as pertains to interface within the operating system and most professional applications is much better. Enforcement of consistency has led to software that generally is able to capitalize on total install base, not just their own. The operating system tends to be much smarter about certain things than Windows is (although not necessarily always with the desired result :) - the dot-three extension requirement is a good example of this. The Mac OS and many of its apps have been better able to support multiple processors and more RAM and HD space until not so long ago. It requires a lot less knowledge to do things like put together a LAN or connect to the Internet. It has far fewer fear factors (at least for me) - I don't need to worry about Passport, for example, and I'm not very likely to have my messenger services turned into tunnels - issues that pervade even while I have home and office firewalls built by the most paranoid of sysadmins.

Windows' bundling of Explorer and other apps into the operating system is also a big negative to a lot of people, and it's beginning to show its vulnerability in the security department (if Internet application can get to operating system...), although I strongly doubt that we've seen anything close to the beginning of that. This is certainly a huge point of comparison and getting bigger. It is plausible that what Apple lacks in device modularity they could potentially make up for with application modularity (although I don't see them taking

advantage of this yet.) I don't have to worry about all my apps getting all tangled up and screwy and registry hacking and what have you. I don't WANT my apps integrated. At all.

The support for non-3D graphics is also, in my opinion, much better. I have finer control, I have fonts that behave properly, and I have many applications that communicate with each other better than they do on the Mac.

Not to mention the emotional advantages, which, for me along with many users, are powerful. I don't like Microsoft. A lot of people don't like Microsoft. I have a great deal of respect for their marketing ability and some other aspects, but I don't trust them at all. I sort of like Apple. I used to like them more than I do now. But I still like Mac USERS a hell of a lot better than I like your typical Windows user, and I still like Apple way better than I like Microsoft, and I *trust* them about a billion times more than I trust MS, at least when it comes to things like privacy.

Windows has also, IMHO, lowered the bar on software and GUI development across the board, partly *because* their system is so accessible to newer programmers, and partly because there really can't be any denying that the likelihood of a version 1 (or even 2 or 3) Microsoft application behaving properly or containing no critical bugs is even less than the likelihood of version 1 Apple hardware not failing within three months.

OS X has made some great strides. I don't think that we've quite gotten to the point Apple hoped we would be at, partly, again IMHO, because of their continuing (and I personally believe stupid) stubbornness surrounding many of the development tools. There have been many occasions (if not most) where the Apple documentation crossed the line from "easy to use" to "useless and totally uninformative." OS X documentation is, in fact, far less useful than that of any of the earlier ones (which is saying a lot), to the point where my exact remark to Apple was that "the only documentation present would appear to have been written for whatever segment of your userbase consists of vegetation." They segregate the users from the developers way, WAY too much, and those of us that are both suffer greatly for it. They created and launched an OS that, while it has huge strong points, was frankly not ready for the standard userbase, bet that people would buy/use it anyway (partly because we are diehard, and partly because we had to), and totally failed to bridge a lot of gaps, notably the upgrade path. I don't know offhand what the upgrade percentages are, but I DO know that I'm a poweruser, and I have been unfailingly frustrated even in just basic areas with X.

I like OS X. I like the IDEA of OS X a lot better than I like OS X, and I think Apple REALLY screwed up GUI-wise in a lot of ways. I still like OS X ten times better than I like my XP, 98, NT (etc) boxes, and it does what I want it to do more dependably and generally better and often faster than the Windows boxes do. The software

selection is too limited, though - Apple has never been good at working well with developers. This is markedly true with Adobe - I don't know what happened there, but for Adobe, a company that has launched versions on Macs since the beginning, to hold back to the extent they did in OS X porting is not a good sign. Even so, the applications that have been running on Macs since their birth continue to run better and more functionally - in general - on Macs than they do on PCs.

If OS X can live up to its promise - delivering a machine where I can, in all practicality, have a UNIX server with my Mac, I will be very happy. Many people try to say this is already true, but I can't agree with that, partly because the UNIX apps on Macs take MORE effort than they already did - which was a lot, and which is not remotely user-friendly. The target market is admittedly small-ish, with few home users that want to write PHP and do graphic design, but I can't help but believe that if they could create a platform that would serve as well as our Linux boxes do (up to and especially including dumping non-core functionality when one wants to and fine-tuning the OS - this is a HUGE problem with X) and/or serve the needs of the desktop user, with no extra expenditure for either audience on their part, everyone would be a whole lot happier all around.

I'm not sure that anyone can properly answer why Macs versus PCs completely without at least part of the answer being "Because." However, I think the same is true of people who love Lambourghinis versus Ferraris, Chinese food versus Mexican, etc. A chunk of it is simple subjective opinion, a chunk of it is what you grew up with, and what's left over is what the systems can actually do.

Right now, much as I love the Mac, the PC is better-suited to the general population, and not just because of the market share. This has become doubly true with OS X, and this is one of the huge reasons that I'm nowhere near as pleased with Apple as I was ten, even five years ago. They have let their hardline licensing stance affect not only their good judgement but their ability to compete in a market of thousands of peripheral devices, they have not yet failed to alienate developers, even many who love the Mac, and for an underdog, they're moving dangerously close to hurting their relationships with even their fans, often by being ridiculously obtuse.

As for publishing - Quark is arse on all platforms, for a lot of reasons, including the Mac. Many newspapers actually use custom systems, especially for publishing, which are usually built for TCO purposes on Windows boxes. Not as many of *newspapers* use Quark these days, though many magazines do. Font support is actually far less of an issue for periodicals, including newspapers, than it is for layout professionals and designers, since they typically have standard fonts that have already been repurposed for every platform in the organization.

I'm hugely irked at a lot of the choices Apple made with OS X, especially with the GUI (and more especially because I can't CHANGE those options), even if I do still love them best. (Um, hi? Repurposing the iTunes interface for the Finder (upcoming in Panther)? Who's handing out the crack over there?? Y'all screwed up the Finder badly enough as it is!) I do really hope they quit screwing up on some of the fronts they have been seriously screwing up on. I'm still wondering why they ditched the clone possibilties, since price has never been more of an issue. I hope that they stop thinking of their userbase as morons, because we're not, and we can, in fact, deal with changing the security options permanently if we so choose, with viewing all (gasp!) of the files we want to see, with reading help files that contain actual information, and with changing the (GRRRR) freaking default options in our operating system. I hope they start following through on their promises to support developers better, and quit leaving the problems to shareware and IDE developers to address, often with zero (or negative, in the case of Be, for example) support from Apple.

Anyway, for me what it comes down to is that yes, a lot of it IS emotional - and that fact is not helped by the personality split between PC and Mac users (which is pretty obvious) - Mac users tend to be pretty elitist, and PC users love to call us on it, while PC users can often be... um...let's just say "to be articulation-challenged," (although when you serve 90% of the population, that's sort of to be expected, what with the standard bell curve and all) and Mac users love to call them on that, too. Your classic underdog versus 900-pound-gorilla sort of thing. Apart from that, and apart from the "what you know" debate, the systems definitely have their strengths and weaknesses. No one's going to be able to separate the emotional from the functional, however, at least not anytime soon.

it won't do any good to complain to a monopoly! Even though there might
alternatives to MS., it's big enough to be put in that catagory! Gates is
now worth over $46 billion!!! No equal competition always = a poor product
and at a higher cost (ex.: cable TV). Furthermore, most people are computer
ignorant (not that I know a lot but I do know more than most just owning
Atari since '87). To them there is "only" MS or AOL.

Hi Kenneth,

Do you intend to boycott NEWSie too?
Because, when a line start with "begin", Newsie propose to extract the
attachment (and of course, in this case, there's not attachment).

>Does Newsie display this article? (I realise this is really a stupid
>question...)
No, NEWSie just ask to extract the attachment (providing it's
configured that way). The workaround (when the "begin" bug occurs), is to
open the message in an editor, or to use an external viewer.
I do use Newsie, and I suppose I'm not alone, being on an Atari
Newsgroup. So please (on behalf of NEWSie users), don't start any line
wih "begin" :)

Do u guys use expanded resolutions? N.AES has problems with some res
expanders, or even the res itself, seeing as total freeze out of blue.
Increasing qsbchars, cqsbchars. mpipesize and sstack size (usually factor of
2 is enough) solve those.

>to put in "noarchive: yes" in his posts.

I can assure you that there's nothing wrong with my threading...

>Those who can't stand up for what they write and are afraid to be found in
>the archives of Google etc. get filtered out here without further notice...

I'm not even going to try and comment on this, if I do, there's bound to be
yet another avalanche of posts...
Although these posts may not end up in the Google archives, they do remain
for a long (very long) time on private news servers. I.e: anything posted to
CSAST during the last odd 18 months can be retrieved from some. Technically
speaking the posts are not stored, they just remain a long time on their
servers... the drawback is that one needs to subscribe and pay a monthly fee
to have access. Paying a couple of bucks each month, to find out what people
who can't stand up for what they write scribble is worth it IMO.

Cheers from Belgium

Hi Mike,

>It may be just that they don't yet have an English version, so I'm
>being plagued by the language barrier, but when I tried the Tempus
>Word demo, I really didn't like it at all. The interface was not very
>logically laid out (IMO), which made it rather difficult to use
>efficiently straight away.

Unlike the Papyrus interface, the Tempus Word GUI is fully configurable,
you can configure it to suit your needs, if you don't care much for a
grahical interface, you can set it up so that only a small status line
remains, and it's even possible to get rid of that also. In addition every
command/feature can be called up by a keyboard command. The program knows
more or less 500 commands, and these are fully configurable by the user
also, so as far as flexibility goes...

>In my opinion, simple, logical interfaces are much better than having
>every feature in the program (an exageration, of course) represented by a
>button at the top of the page.

A logical laid out interface will be perceived differently by different
users, what's logical for you might be illogical for me and vice versa of
course ;-), the menu's and menu-items weren't created on a blue monday,
they're the sum of 14 years development and a very impressive input from
the Tempus Word users, IMO they couldn't be placed more logically then they
are right now. But then again that's personal perceivement also, you may
find it quite logcal that in Papyrus for example one needs to go and search
in the paragraph menu to activate hyphenation or to revert back to text-
mode in the graphics menu... for me, however that's not very logical.

>Could someone tell me specifically what Tempus' advantages are over
>Papyrus?

I could, but I'm not going to ;-)
Not because I don't want to but because it's much too early. Just like with
Papyrus you need a well written manual to get the best out of Tempus Word,
giving you a nice long list now of all the advantages wouldn't do any good,
since you wouldn't have a clue how to let those advantages work for you.
Let's discuss this issue once that the English version is here...

>I personally haven't seen all that many bugs in Papyrus that people keep
>complaining about (although I have seen a few very minor ones),

To encounter certain bugs, you have to use certain features of the program, if you don't you'll never encounter them, but that doesn't mean they're not there... and in addition almost everyone who posted claims the same thing as you do, they all know a couple of minor bugs... put all those different "minor" bugs together and what do you get?
When it was announced here that in september an English version of Papyrus 9.xx would be released, I replied and wrote that hopefully some bugs that have been around for 6 years would be fixed... and before I knew it I was accused of bashing Papyrus. Someone asked me to sum up the bugs, and I've obliged... and that's about all I can do. And there are many more bugs then the ones I've summed up, but I think it's only fair to sum up bugs one has experienced himself.
Almost any program has bugs, but the difference is that ROM doesn't seem to be very keen to fix them, I experience this as a disregard to their users, until today, people had no other choice then to use Papyrus, Tempus Word offers a different path to achieve the same goal, and who knows, now that Papyrus get's some competition, that might be the incentive to finally debug the program...

>and from the Tempus demo couldn't really see any advantages, while I see
>lots of advantages with Papyrus

Mike, I get the impression that you won't give in until at least one advantage is shown to you... ;-)
OK: load a large ASCII text file, let's say minimum 1 Mb, (it needs to be large to show the advantage) in Papyrus, and clock the the time needed to load and format the document.... do the same thing in the Tempus Word demo, and there's the first advantage: minutes versus seconds... next, change the standard Papyrus page layout to a 2 or 3 column layout and instead of the ugly ASCII font assign a TTF or Speedo font, and clock the time needed that Papyrus needs to do this... you don't need to time anything in the Tempus Word demo, because all it takes is a mouse click, so again we're talking minutes vs seconds...
And here's a very extreme example: at the moment I'm busy editing a Dutch thesaurus, that file is 23Mb large, loading, formatting, and displaying it in a custom made columm page layout takes exactly 4'10" with Tempus Word. I can't give you the Papyrus figures because after more or less 25 minutes formatting text, it bombs out on me... for the record, these figures are from the TT, not MagiCMac or the clone.
Minutes versus seconds or stability may not mean much to you, but it does to a lot of people. Tempus Word is a professional tool, one can say a lot about Papyrus, but it definitely doesn't belong in that class.

>to me, it's *much* better than MS Word, Apple Works, and just about any
>other Word Processing program I've used. Like I said, maybe things will be
>better when they get an English version made, so I can honestly see the
>sum total of Tempus' features. Until then, I'm happy with Papyrus and its
>simple, elegant interface.

Almost anything is better then MS Word or AppleWorks ;-)
But try to imagine that you never heard of Papyrus before, and that you download the German demo from the ROM website, I think that your reaction

would be more or less the same as for the German tempus Word demo. So let's stop this tread and wait a few months for the English version... I wouldn't be surprised if it's here before the English papyrus that is supposed to be released this month... only 9 more days to go.

Cheers from Belgium
Dennis

Hi Mike,

>This is of course true, which is why I can't understand why some
>people here simply dismiss certain software as being "crap" in
>general, instead of stating what does and doesn't work for them

Well I did, and as a matter of fact I went through great lengths before I posted the post. I tested and reproduced every bug that I summed up. It's easy enough to say that one has to state what doesn't work, but then one gets the reaction that he's bashing the program.... it's very difficult lately to do anything right in here :-(

>>I only own Papyrus as a demo version, and I don't use it mainly
>>because of the way accented characters have to be obtained :-(
>
>I can definitely see how this can be a deterent. It's not a feature I
>ever make use of, being an English speaker/writer, so this is a valid
>point, especially for French-speaking users.

It is a very valid point, English is one of the very few languages that has no accented and or special characters, but considering that Papyrus is a German program and that the German language has quite a lot of special characters also... Papyrus however can handle Unicode, and that defeats Jean Luc's complaints for a great deal.

>Yes, I've noticed. The way to solve this problem is to change most of
>the
tags to
tags. What they probably should have done is only
>use
when hitting "Return" after a paragraph, and
for all
>other "Return" hits. Most browsers won't add extra spaces every time
>they run into
, but will with every
.

I agree, and just like we agree, hundreds more users agree on this, but ROM doesn't seem to care. Constructive input is nice in theory, but if the developers are deaf....
BTW: that's another advantage of Tempus Word over Papyrus, the Tempus Word developers not only listen to the users but also implement suggestions.

Hi John,

>What's the feasibility of a program that can sense line condition while
>connecting to an ISP? Terminal prgrams can get the modem data after
>disconnecting but that's too late to use!

Check out Iconnect from ASH (included with CAB).

Create a START folder in the PPP folder, and drop CON_INFO.PRG in that folder
which is located in the PPP/TOOLS folder, whenever you connect you'll get all
the necessary info displayed on the screen.
BTW: STiK/STiNG and Iconnect can both be in memory, there's no conflict when
you run them both ...

Cheers from Belgium

>german.

Agreed about Diskus. Beware of KnifeST with large disk partitions
- specially VFAT ones - and don't try the disk checking function
with them as the results are incorrect.

One of the best disk editors I know is the monitor function in
Harlekin - besides accessing files, it can also access partitions
and hence directories, and has a reasonably fast Find feature.

But as Uwe has said, you can only use disk editors for undeletes
when you have not written anything else to the partition since you
deleted the file or folder. Also, probably only if the file has
been written to consecutive sectors rather than fragmented, as the
FAT table may not be correct or accessible.

For accessing files only (i.e. *not* directory entries), HexEdit
is good too, but slower. With it you can replace strings with
longer ones - no good in executables, but useful with text files.

There are a couple of undelete utitlities, but I have not been
able to use them with a Falcon and/or MagiC on hard drives - don't
know whether this is due to the large partitions I am using. Same
goes for the undelete function in Diamond Edge, which reports
negative sizes for my 840 MB partitions, so I wouldn't trust it.

In article <200309211719.a22622@ll.maus.de>,
Martin_Elsaesser@ll.maus.de (Martin Elsï¿½sser) writes:
>
> RS>I've currently got 18 rules that seem to be nabbing 95%+ of the Swen.A
> RS>worms, though. If anybody's interested, I can post or e-mail the rules
> RS>I'm using.
>
> I'm interested, please post your rules here!

Here they are (they've expanded a bit since I last wrote). Remember, these
are rules for the mailfilter (http://mailfilter.sourceforge.net) package,
but it might be possible to adapt them for at least some other similar
tools:

```
DENY=^From:.*Customer Bulletin
DENY=^From:.*(Email|Inet).*(Service|System)
DENY=^From:.*Internet Message (Service|Storage System)
DENY=^From:.*Internet Security.*(Department|Section)
DENY=^From:.*Mail Storage System
DENY=^From:.*Microsoft
DENY=^From:.*(Microsoft|MS).*(Assistance|Corporation|Customer|Delivery Services|Delivery
System|Internet Storage Service|Mail System|Net Storage
System|Network|Assistance|Security)
DENY=^From:.*(Net|Network|Storage).*(Client|Message System|Service)
DENY=^From:.*Network Security Division
DENY=^From:.*Program Security
DENY=^From:.*Public Support
DENY=^From:.*Security Section
DENY=^SUBJECT: Abort (Letter|Notice)
DENY=^Subject: (Current Critical|Last Critical|Latest Net|Microsoft|Microsoft
Critical|Microsoft Security|Newest).*(Pack|Patch|Update|Upgrade)
DENY=^To:.*(client|receiver|recipient|user).*(yourdomain|yourserver)\.(com|net)
DENY=^To:.*(Commercial|Email|Inet|Internet|Mail|Net|network).*(Client|Partner|Receiver|Rec
ipient|User)
DENY=^To:.*Consumer
DENY=^To:.*Customer
DENY=^To:.*(Microsoft|MS|Net).*(Client|Corporation|Customer|Partner|User)
DENY=^To:.*Partner
DENY=^To:.*User
```

Some of those lines are quite long and might wrap on some newsreaders, so
watch that. Also, some of these rules are overly broad, like the one that
matches anything with "Microsoft" in the From: header. If I keep these
rules in the long term, I'll almost certainly trim some of them once the
current flood subsides.

Anyhow, upon reading the mailfilter documentation more closely, I see that it also supports a DENY<> directive, which matches anything that does NOT fit the regular expression you specify. Because W32/Swen.A doesn't include your real e-mail address in its From: header, a simple single-line rule should do the trick:

DENY<>^To:.*yourname@yourisp\.net

Change "yourname@yourisp\.net" as appropriate for your account, of course. I've not yet tried this, but a similar rule I'm using in procmail works wonders. A big honking caveat, though: This rule will discard mail from mailing lists and anything that's sent to you as a BCC. Thus, you might need to adapt it or include separate ACCEPT= rules to override the DENY<> rule for known-good senders.

It looks very interesting, Frederic! I've seen CF adapters for IDE before, but having one set for an Atari would be a very nice silent option, and 512MB (even 128MB) is quite a usable hard drive for an Atari.

I wish you the best of luck on your task.

Galen

Hello everyone,

Working with my Falcon in 030 mode (there's a CT60 in it, but it's not "on") I ran ICD tools one last time to make sure everything worked. [It did.] I then installed my nice new HD Driver 8.13. I had a couple of lockups after installation however, so I figured I'd repartition the drives in case HD Driver had issues with the ICD formatting. This was a big mistake. Now, regardless of whether I use ICD or HDDriver the computer freezes whenever I attempt to access the drives. This occurs when I use the AUTO folder, start from floppy, or even just try to scan the SCSI bus. What on earth happened, and does anyone have any idea how to get out of it? Both my 1.08GB and 340MB drives are failing to respond in any manner!

I'm not familiar with mailfilter but can it filter on more than the header?
If so, then you could trigger it on the mime preamble.

SNIP

Oh, also useful is "top <message number> <lines>". eg: "top 1 20" will show
the first 20 lines of message 1 in raw text.

The virus will be a lot bigger than 23238 btw (145,000 -> 160,000).

Well this is exactly what I mean. Take a moment to think how it works:

Why does line quality influence speed? Because some packets get
corrupted and have to be sent again. Since all this is solved at IP and
TCP levels, you don't "see" this happening. All you see is the speed
decreasing.

When you use PPP echo requests, there is no error retrying etc what so
ever (just a correction attempt on the modem itself but that doesn't
take any time because it corrects packets on the fly, if at all
possible). So while at high level, bad line quality results in slower
transfers, at the low level of ppp echo requests, bad line quality
results in packets not being replied to.

> when you say PPP level are you referring to ping? if so, Sting has that
> feature but Stik (which I use) doesn't.

Yes it does (IIRC it's a separate program), and no that's not what I
mean. :) Ping lies on top of the ICMP protocol which lies on top of PPP.
It also will loose packets when the line quality is bad, but since
you're pinging another host on the internet you're testing the
connection between you and the other host, not knowing what other
disasters lie hidden inbetween.

What I mean is exactly this: "PPP echo request". It's in the PPP RFCs.
Again it tests nothing but the direct physical connection between your
modem and the modem you're talking to. If you get a dozen of packets
responded to correctly, your line is perfect (or close enough). :) If
one or two out of ten packets get dropped, your line is bad but usable.

Maurits.

Hi Maurits,
Ok. I'm kinda' folowing you! So where do I get "PPP echo request"
program? In the package of Iconnect/Tools there's con_info, get_ip &
net_time. Con_info looks like what I need but Iconnect is crashing after
"get IP" and RSDAEMON.PRG remains at the top of the screen in a locked
computer (must reset). I tried "Terminal On" and it did'nt crash (saw the
data going by) but that's as far as I could get!

John

fooled it? Don't see how when it showed the Attachment: dfhjqnb.exe
which when extracted gives a line of data starting with ms or mz or
something or other!

Well that's the difficult part, it's part of PPP so it should be in the ppp layer; you'd have to somehow tell it to send a request. I don't know which (if any) of the Atari layers has a function to do this. I'm sure they are all able to reply to echo requests from the ISP, but I guess they'd need some kind of function call in their API to send one and tell you the result.

Ah, I guess I'm spoiled. Back when I was 12 years old and in school we
had several analog editing decks. After using them I resolved to never
get into video until things got better. Now I've got my Mini-DV cam, Kino
and Cinelerra for linux :) Things got better. Just as well I can see the
attraction to the expose, but I suppose it's doubtful you'll find
excellent editing software like you will on a Mac.

Nothing on the Atari is just a toy :)

With Rainer's software it is possible to display the video on the NOVA card.
:-)

> I'm still holding off on the CT060 installation until the NOVA VDI is
>working:)

You shouldn't. Although I lost higher resolutions the speed increase (even
compared to my afterburner setup I had before) in raw cpu power (~factor 2-3)
is so dramatic that I wouldn't go back to my "old" falcon. :-)

Regards,

Frank

Dennis,

Thanks for your reply. This is exactly the kind of response that
I've been wanting to see - very respectful, well thought out, and
gives excellent points! Something I don't see very often in this
newsgroup recently...

> >It may be just that they don't yet have an English version, so I'm

> more or less 500 commands, and these are fully configurable by the user
> also, so as far as flexibility goes...

This is good to know! As I said, I haven't been able to get too deep
into Tempus Word's features due to the language issue. This would be a
big help! I noticed that in the PC version of Papyrus, they have a
configurable GUI, which the Atari version doesn't have (at least as of
8.23 - the last English version they released).

> >In my opinion, simple, logical interfaces are much better than having
> >every feature in the program (an exageration, of course) represented by a
> >button at the top of the page.
>
> A logical laid out interface will be perceived differently by different
> users, what's logical for you might be illogical for me and vice versa of
> course ;-)

Good point, and I agree 100%. I guess what I was trying to get at was
a variation on that theme: What's crap to one person might be just
fine for someone else, so it's good to have the choice, but not good
to necessarily rag on a program because it isn't to your liking. Then
again, I guess some could read that into my response to Tempus. If so,
I apologize - that was not my intent.

> >Could someone tell me specifically what Tempus' advantages are over
> >Papyrus?
>
> I could, but I'm not going to ;-)
> Not because I don't want to but because it's much too early. Just like with

> giving you a nice long list now of all the advantages wouldn't do any good,
> since you wouldn't have a clue how to let those advantages work for you.
> Let's discuss this issue once that the English version is here...

Well, as with a lot of things on this platform, I heard about Tempus Word a little over 2 years ago, and they were working on an English version then, and it's still not available. So that's part of my frustration with that program. For now, even with its drawbacks, Papyrus is the best/only option for a really full-featured program for English-speakers. Hopefully that will change soon. I very much enjoy having options.

> Almost any program has bugs, but the difference is that ROM doesn't seem to

> until today, people had no other choice then to use Papyrus, Tempus Word
> offers a different path to achieve the same goal, and who knows, now that
> Papyrus get's some competition, that might be the incentive to finally
> debug the program...

I can see that. I haven't been too impressed with the company itself - just the program. I am (was?) on on their English beta-tester list, but when I send them any bug reports, they either don't reply or tell me they can't reproduce them. And more recently, I ran into another minor issue and they said they couldn't be bothered with bug reports from such an old version and from such a "dead platform", even though version 8.23 was the last English Atari version they made, so it was the only thing I had to test. So, I'm not too happy with them as a company. I just like their software better than anything else I've seen (that I could understand enough to give a fair comparison to).

> about Papyrus, but it definitely doesn't belong in that class.

Ok. That works. I usually don't work with files that large, so I never
run into that problem. Thanks for pointing that out!

> >to me, it's *much* better than MS Word, Apple Works, and just about any

>
> Almost anything is better then MS Word or AppleWorks ;-)

:) It's so unfortunate that such horrible programs have become the
"standard", specifically in the Microsoft case.

> But try to imagine that you never heard of Papyrus before, and that you

> released this month... only 9 more days to go.

I hope it's that soon - I've been waiting on that one for a couple
years now. It seems like that's the case for just about everything on
this platform. People/companies state that something will be released
by a certain date, and a year or two past that date, they are still
making up new dates that it will be released by. I would rather just
have them say that they're working on it, but it may take some time,
or not say anything at all, and then release it if/when it's ready.
I'd rather have a good surprise like that instead of a bad one like
seeing that it's not nearly done when it was stated it would be.

Anyway, that's another issue altogether. Thanks for your reply! I'll
definitely look for that English demo version, and then do a better
comparison of the two than I did before.

6658. 3.5" DSDD ("720K") diskettes

Newsgroup: comp.sys.atari.st
Date: 2003-09-22 19:33:29 UTC
From: "Glen G." <glenatacme@aol.com>
Message-ID: <01c38140$10398140$118f4f3f@thegoodw>
Source record: 23539

Hi --

I have a number of old computers which require 3.5" DSDD diskettes and recently had an opportunity to purchase some of them (more than I will ever use, but I had to purchase the entire lot). A friend suggested that I post to a few Usenet groups pertaining to machines which have the same requirements -- somebody else probably could use some of these, too.

Here are the details:

Retail 10-diskette boxes, Certron brand, shrinkwrapped, inner plastic sleeve, labels included. Look and act just like brand new. I opened a couple of boxes and formatted half a dozen diskettes without incident.

They're packed in a couple of different-sized cartons: 10-box and 42-box. Cost: $1 per 10-diskette box, minimum 10-box order (one 10-box carton). USPS Media Mail is the best bet for shipping: $3.52 (for a total of $13.52)

for a 10-box carton (100 diskettes), and $8.74 (for a total of $50.74) for a 42-boxer (420 diskettes).

If you prefer, I can ship via UPS, but it costs a few dollars more.

I'll ship them from my company address, so I can accept PayPal, VISA, MasterCard, American Express, or Discover. If you have another payment option in mind, please let me know.

If you want in on this deal, please send a note to glenatacme@aol.com. I'll reply privately and if you're in the USA I'll include my toll-free number so you can call and we can discuss the details.

BTW I'll be happy to ship internationally.

Any questions drop me a note at the address mentioned above.

6659. TT030

Newsgroup: comp.sys.atari.st
Date: 2003-09-22 20:11:54 UTC
From: Jason Lowmiller <jlowmiller@yahoo.com>
Message-ID: <XBIbb.12$eJ3.0@fe05.atl2.webusenet.com>
Source record: 23540

Heya everybody. A friend the other day gave me a TT030 that he had sitting in his closet. I couldn't believe it when I saw and instantly fell in love with it. This is my first Atari and my first experience with the TOS/GEM systems. Does anyone have or could point me to a website that would contain documents that could help me understand the operating system. While I was playing around with it (being a little hasty) I deleted some files from a directory and now I get three bats(?) on the screen and it halts everything from that point. I have absolutely no idea how to use the TOS/GEM system and some of the responses it gives me seems to be a bit buggy sometime. I'm sure that this TT was fitted with an earlier version of TOS, is there any way I can upgrade this? I have an e2prom burner, and was wondering if i could obtain the source of the later TOS revisions and burn it, but finding atari documentations on the internet has proved futile.

I'm also looking for a VME ATI Rage and any books that may have come with the TT.

TIA

Jason

6660. monochrome display on atari falcon?

Newsgroup: comp.sys.atari.st
Date: 2003-09-22 20:52:51 UTC
From: Brrt <brrt4pres@hotmail.com>
Message-ID: <bknni8$1jq$1@netlx020.civ.utwente.nl>
Source record: 23541

Is it possible to connect a monochrome display (9 pin subD) to an atari falcon (19 pin subD)? Is there some kind of adaptor or schematic?

greets, Brrt

6661. Memory upgrade on a 1040Stf

Fine for someone else doesn't make the bugs go away, or that they aren't there, it means you've not yet found out what proportion of your money is wasted?

There's a clue in there. I'm sure there is. Something to do with you saying
it IS an attachment coupled with the fact I said it's NOT an attachment.

Actually there were *two* non-attachments (followed by a telnet session)!

It would be tricky to do it on the body as obviously worst case scenario is having to read the whole thing to get the match. Either you'd have to have the software read the whole thing anyway or do fixed or ever-increasing TOP's which would be very inefficient.

That'd be true if you wanted to have the capacity to filter on anything
in the body. (Actually, the smarter thing in that case would be to just
download the whole message, or put the filter on the mail server.) A lot
of spams and malware have uniquely identifying information in the first
few lines, though. You could program a system to retrieve, say, the first
ten lines of a message and scan that. If you don't get any hits, leave it
on the server (and download the whole thing using your regular mail tool,
which might or might not employ full body scans). Sure, you'd be likely
to miss the opportunity to delete some spams/malware on the server with
this approach, but no system is perfect, and the ability to scan even a
few lines of the body MIGHT enable you to nab enough extra messages to
make the extra bandwidth requirements of this check worthwhile.

> falcon (19 pin subD)? Is there some kind of adaptor or schematic?

You mean Atari monohrome monitor? Yes, there are adaptors for that. I do not know if schematics exists. But if you succed you should go to http://draco.atari.org and download a program that allows falcon to use a bit better resolution on such monitor.

That depends on what exactly you want to do with it. You can edit without a keyboard, although I think there are not many editors in Cubase Light (if any..) but the ST won't be making any sounds if that's what you mean. You probably used a PC soundcard with it's own midi-controlled soundset.

To say it's "possible on PC but not on Atari" would be unfair.. I'd prefer to say: Like for the PC you have to buy a soundcard with its own set of midi-sounds, for the Atari you'll have to buy at least a midi soundmodule (a second-hand Roland Sound Canvas or TG-xxx should be pretty cheap). And it will give a much nicer result than the crappy sounds they stuff in soundcards. :)

so, what did Newsie find (or think it found) if not an attachment with
the name dfhjqnb.exe which could be extracted? I read that Newsie has a
problem with a line that starts with "begin" but that wasn't there! Am I
looking at this from the wrong angle? Either way, it certainly was
disconcerting to see that happen in a thread on viruses!

I have the Atari Falcon to hi res SM 124/125/144/146 adaptor which will
allow you to connect any of these AND will also make it easier to identify
the correct pins if you want to make your own hi res adaptor, it's easier to
find a 13 pin din plug than a 19 way D.

I can also supply a hi res SVGA adaptor to fit the Falcon adaptor.

Now I'm a little confused. I have a Falcon-to-SVGA adaptor, but I can't
connect a monochrome (9 pin) display to that adaptor. So this won't work,
does it?
What's a hi res SM 124/125/144/146 adaptor? I'm a newbie here, so I don't
know what you mean by this. Does it convert Falcons 19 pin-VGA to my 9-pin
monochrome?

Yep. Newsie got it wrong. Unfortunately as I don't know the precise details of the newsie bug (?does anybody?) I'm not sure what I can type before you suddenly see an attachment instead of this text. Basically I pasted three lines that had "Content hyphen Type/Transfer/Id" respectively then just first two lines of the encoded virus. Then I repeated but the second time with a different pair of "first two lines".

Those first two lines appear to be common to the virus reguardless of what subject etc it generates, so a filter applied on the pair of them ought to uniquely identify the virus reguardless what subject etc it forges for itself. Long & short of it was you probably didn't miss anything

interesting. ;-)

> Either way, it certainly was
> disconcerting to see that happen in a thread on viruses!

Certainly, which I why I tried to put your mind at rest. Even if I had posted the entire thing it couldn't have infected an atari of course. Btw, there's another thing cropping up and its news this time. As it happens I just saw an example of it the c.s.a.s.t group entitled "Take a look at internet patch", a couple of gif's plus (so far, an empty) zip attachment. Dunno anything else about these atm but worth a mention in case they also confuse newsie (the zip's aren't valid).

Yep, the fixed TOP is about the only realistic choice when header matching isn't up to the job. Dunno about yourself, but I personally feel that the seeds for this were sown years ago with dynamic IP necessitating POP etc in place of STMPd.

There was something much more satisfying watching the demon "punts" connecting to Ka9q (smtpd mode) just after dialup. It'd be followed by a lot of swearing of course as the two "missed" each other and that horrible choice of waiting 15mins before they tried again or doing a redial (oh the cost!). :-)

> monochrome?

People are misleading you a bit.

What you want is a 15pin-9pin VGA adapter. That 9 pin is for older video cards but more or less they are compatible. As long as that laptop monitor can do 640x480 it should be compatible for the most part with your falcon. Although the resolution your falcon will run in by default will be color. The falcon will be faster if you switch to a 2 color mode (what's the point of using color on a mono monitor). Point is the falcon outputs VGA, that monitor inputs VGA. A little adapter should do it. But this is more of a general PC thing then anything related specifically to atari. But yeah, it should work. I do have one of these said adapters, but it's mine and you can't have it ;-). It's to adapt one of my 9 pin out video cards to a 15 pin SVGA monitor.

What other people are encouraging you to do is a little nonsensical. They want you to use the RGB outputs of that same falcon video connector to pull the authentic ST resolutions out. If you do that then you can only use ST-high (640x400) on that monitor which is smaller and probably won't display well on an LCD monitor of that nature. So in essence they want you to go Falcon -> special RGB adapter that you don't have -> special RGB to VGA adapter that doesn't exist except at 2 stores (but admittedly is easy to make) -> your monitor, when since you have a falcon all you have to do is falcon video out -> SVGA adapter you have -> 15pin to 9pin VGA adapter -> monitor. Much simpler and more flexible :)

Good luck
Mark

It was an idle thought. I wondered if...

(a) Newsie does a case-sensitive scan (unlikely)
strcmp(s,"BEGIN") //???

(b) Outlook does a case-insensitive scan (likely)
stricmp(s,"BEGIN") //???

...then everyone could use "BEGIN" <g>

HEY!!! THANKS ALOT! Those sites are extremely helpful.

Last night, I've pretty much figured out how to get it to boot from a floppy and I installed a new(er) scsi hard drive. Its about 500 mg. Is there some sort of limitation to the size of partitions that TOS recognizes? I had some trouble with a large partition of 500 mbs. but I changed them aroud a little and it seems like anything underneath 100 is ok.

Good thing I found that illegal copy of HDDriver. J/K Uwe :)

I use OE on this gateway box as I've not found any other program that does everything it can do as easy. But having said that, you'll note by the line at the end of this message, not only do I run a good virus protect software, I also went into the dark damp basement of OE & windows and made changes, such as any message that comes in with either a .scr or .exe go's right into the un-recoveable trash can. Then also my ISP has set up virus/spam filters on their users accounts and that is working too, has stopped many virus.

I also changed the default encoding to UUECODE instead of the mime one.

So while I try to find a modem for my TT, at lest this machine has major road blocks set up.

so, what did Newsie find (or think it found) if not an attachment with
the name dfhjqnb.exe which could be extracted? I read that Newsie has a
problem with a line that starts with "begin" but that wasn't there! Am I
looking at this from the wrong angle? Either way, it certainly was
disconcerting to see that happen in a thread on viruses!

John

Here's a quote from Guys article that had the non-attachments, quoted to
stop triggering this bug in Newsie:

>--tyyrcvojv
>Content-Type: audio/x-wav; name="dfhjqnb.exe"

>I read that Newsie has a problem with a line that starts with "begin"
>but that wasn't there! Am I looking at this from the wrong angle?

Not really. It looks like a bug in Newsie, similar to the "begin " bug.

Farnells[0] do the 19 way D, although they only sell them in multiples
of 5. Bit of a pain if you're only wanting the 1. As for a cover for the
connector, I'm not sure if they sell those as well as I've not yet found
the time to go through each of the individual covers returned by their
catalogue search to see which one is the right one.

>Now I'm a little confused. I have a Falcon-to-SVGA adaptor, but I can't
>connect a monochrome (9 pin) display to that adaptor. So this won't work,
>does it?

It should - my Falcon came with a 25 to 9 pin lead, and that works
both on monochrome VGA as well as color SVGA monitors.

>What's a hi res SM 124/125/144/146 adaptor? I'm a newbie here, so I don't
>know what you mean by this. Does it convert Falcons 19 pin-VGA to my 9-pin
>monochrome?

No, that converts 25 pin D to the 14-pin DIN socket to fit
standard leads for the older Ataris and hi res monitors.

But then this 9 pin will have a VGA pinlayout. According to
http://www.monitorworld.com/Cables/video_standards.html that isn't the same
layout as monochrome (with intensity and video signals instead of RGB).. Or
am I wrong here?

Hrmm.. If 9 pin monochrome isn't the same as 9 pin VGA then I have
mislead you and am not sure where you should go. Maybe to the store to
buy a nice 15" LCD monitor ;-)

The ST did not use SIMMS (the STe did). You can find adapter boards
that solder in to the ST to add more memory, but they are rare.
Unless you really enjoy component level electronics, I'd recommend
just buying a used STe or ST with more memory.
>
> And another question..

You can use SCSI on the ACSI port with an interface called the Link.
There is also an internal IDE interface available.

there's a chance that Diamond Edge can install a boot sector.

Source record: 23493

From: "Kenneth Medin" <kennethm@tripnet.se>
Date: Sat, 20 Sep 2003 23:12:20 GMT

Hi Kenneth,

>Because I got so angry from all these SWEN virus mails comming from
>infected Windows users I came up with the idea tonight to boycott Outlook
>Express users by exploiting an old bug in that program.

It's a nice thought but not very effective, and in addition it also affects
genuine Atari users using Newsie...

>As a side effect more users would go to WindowsUpdate and fix there old
>buggy OE installations and less SWEN viruses would spread because of un
>patched OE versions.

Don't count on it... for every bug that gets fixed, another loophole is
found or created. This is a continuing story....

Besides, it's your mailbox which is being attacked, not this newsgroup...
If you want to boycot Outlook, Outlook Express and Entourage users without
affecting Newsie users there's a better method. Almost every ISP worth his
money had some sort of SPAM filter implemented now, simply put all mails
created by MS crap in that filter... and you will never ever see one in
your mailbox again. Let the people using that crap know in advance that
their mailer is "blacklisted", and if someone really needs to get in touch
with you he'll have to use a different mailer. This is the most effective
way to boycot users using MS crap IMO and in addition doesn't affect anyone
but yourself...
If enough people would do this (30% of the mails is generated by different
mailers), then it could have an effect, if only you do it then it's like a
drip of water on a hot plate of course :-/

Cheers from Belgium
Dennis

Hi Neil,

>HELP how the heck can I get rid of preferably
>everything in my ISP Mailbox? Is there somewhere to
>go/some Iconnect or STiNG utility/or mail someone
>(who?) at Freeserve?
>
>Please answer here, as I may not pickup an email ever
>again!!!

This is not an Iconnect & Emailer problem, but more likely a problem at
your ISP servers end, some servers have a very short time out status...
Anyway, start up IConfig and activate the PRO mode, then go to TCP and
increase the values for Connection and Transmission timeout to 99 seconds,
enlarge the receive window to 4096 if you want to read the full headers...
Don't forget to reset the original values once that the probem is solved.

ATM someone is working on a ASH Scripter file for Emailer which will take
care of this particular problem, the script will automate the whole lot,
leaving enough time to get around the server time out problem.

Date: Sat, 20 Sep 2003 23:25:13 +0000 (UTC)

Hi Steve,

>We seem to always miss something when we get onto this subject, its the
>people exploiting the software holes that need stuffing, not the poor
>barstard that's getting exploited. It may be an MS product on the
>receiving end but the problem is caused by the virus writers.

Sure, but that "poor bastard" isn't forced to use that particular software,
in fact he has lots of choice. In persisting to keep on using the affected
software, he prolongs the situation. So that "poor bastard" is more or less
a masochist, which is just fine by me.
But once I'm at the receiving end, things get a little more complicated, I
or anyone else don't need to suffer because some "poor bastard" out there
is to stubborn to use different software. Although the viri don't affect
my system, the mails they're attached to affect my mailbox. The last few
days I had to wade through almost 750 mails sent by different people but
all generated with either Outlook or Outlook Express.
As far as I'm concerned both these so-called mailers are spamming tools,
and from now on I'll treat them like this also, from october 1st anyone
sending me mails generated with that crap their mails will end up in the
GMX spam filters, this is a general notice BTW.

Cheers from Belgium

well yeah, but unfortunately this particular virus is sending itself
to addresses it gets off usenet too. So for every retard that gets
infected I seem to be getting several emails, at its peak this was
about 1500-2000 of the fuckers a day.

I'm running an immune OS, and I have a decent connection, and it is
still pissing me off, I pity anyone getting hit with the same amounts
as I am who is on a dial-up.

Hi Rudolphe,

>I already did that 2 years ago (more !) and I had only 25 people !!!
>So, now how could it be better ???

Personally I never heard/read about this, but I do remember that back in
december 1998, a proposition was made for a so called CT-TT board, and IIRC
the projected minimum was 100 boards. In this newsgroup alone some 30 people
expressed an interest, many of them wanting 2 or more boards...
In the French newsgroup some 25 people expressed an interest and in Germany
no one knew about it....
I've posted the quoted announcement to the German maus hardware group
back in february 1999 and in less then a week almost 80 people reacted and
said they were interested, about a month later the German dealer Peter Denk
gmbh reacted and said he would take 25 boards to start with.

And ever since I'm waiting.... :-(

If you wanna look it up on Google,
search for "TT030 at 64Mhz ??? Interested ?" and related threads, started in
december 1998...

Cheers from Belgium
Dennis

6714. Used drive works

Newsgroup: comp.sys.atari.st
Date: 2003-09-24 17:41:16 UTC
From: Jim DeClercq <jimd@panix2.panix.com>
Message-ID: <bkskvsltl1@reader2.panix.com>
Source record: 23491

I found a used Seagate Barracuda 32550W, which reports itself as a Compaq 32550W, and got it working, and in the process learned something. This is a 68 pin drive.

On this drive, you do not want SDTR jumpered. And, you do not want either ENA MOTOR STRT or DEL MOTOR STRT jumpered. The only thing to be jumpered is PARITY DIS. As to the motor start things, if neither is jumpered, it ignores the Motor Start command, and spins up when power is applied. That is what I wanted to happen, and it works for me.

Not documented on the drive case is TERM PWR, which I think is on the connector on the front. I do not need it. I have an almost full bus, and something gives me TERM PWR.

This is an external drive, for a TT030, and I am not trying to boot from it. The drive was a pull, supposedly tested, in upgrading a machine.

68-50 pin adapters are getting harder to find. I got mine from Black Box Network Systems in Lawrence, PA, USA. They have good fast service, and act like they know each incoming phone call might be a customer. They have a web presence, which I think is www.blackbox.com. The one I got is active termination, and they call it right angle. To me, it is in the shape of a folded periscope, and adds very little to the length of the drive.

I am using that as a MiNT (oh, horrors) drive. The one thing that puzzles me about this drive, a 2 gig drive, partitioned as two 1 gig drives, is that the only thing that could find the second half of that drive to install a file system on it was the EasyMint installer. I saved the MINT and EASYMINT files on the C-drive to elsewhere, installed a duplicate MiNT system, and erased its files to get both halves of the drive recognized.

Am using HDDriver, and am most pleased with it.

Yes and there are other holes out right now. Tested my fully patched
MSIE6 at http://www.secunia.com/MS03-032 and it is still wide open for
anyone to invade. Solution: TURN OFF ACTIVEX!

>Besides, it's your mailbox which is being attacked, not this newsgroup...

You are partially wrong here. The SWEN virus captures email adresses from
newsgroup messages. I get quite a lot of virus mails from abroad and the
only international newsgroups i visit are Atari related.

The conclusion is that there are people reading this newsgroup using OE
that are sending lots of mail to my address.

The question is: Why help these by answering questions in a newsgroup??

No, the problem is that there is a "mono culture" out there with almost
nothing except MS Windows using OE. this puts a very heavy burdon on MS
to make there software extremly safe or there will be massive problems.

The very fact they have an almost monopoly position does not help making
there software any better.

This is where we Atari users actually make a (very small) difference. I'm
certain my STinG setup is vulnerable in some way but it does not matter...

In a world with lets say 6-10 different operating systems running various
software with the market spread evenly among them there would be far less
virus, etc. problems...

>is to stubborn to use different software. Although the viri don't affect
>my system, the mails they're attached to affect my mailbox. The last few

And you call that lots of mail... I got 1744 yesterday and 1120 today.
Fortunately MEG does a very good job emptying my mailbox every 5 minutes.
Runs on my webserver TT.

>all generated with either Outlook or Outlook Express.

They are not. This virus uses (afaik) its own SMTP engine to send the
mails.

No problem. It was just because of the double meaning of "shot".
I understand now you were meaning: "Is is worth trying BEGIN (i.e., in
full uppercase).
>It was an idle thought. I wondered if...
>
>(a) Newsie does a case-sensitive scan (unlikely)
>strcmp(s,"BEGIN") //???
Unlikely, but true.
Rather: strcmp(s,"begin")
>
>(b) Outlook does a case-insensitive scan (likely)
>stricmp(s,"BEGIN") //???
I can confirm that any variation of "begin" which is not fully in
lowercase doesn't trigger the NEWSie bug. I.e., NEWSie won't ask to
decode an inexisting attachement. I've tried with "Begin", "bEgin", etc.
Only "begin" (full lowercase) triggers the bug.

SO you're cutting me off then!!, Thing is I'm using a firewall, selective filtering and a continuously updated Anti Virus.

Most of the current viri aren't generated my MS products at all, they are generated by the virus internal SMTP server, that's what makes it such an arse. It relies on a prat executing it to bypass any simple security, this instigates its own personal SMTP server that analysis the host address book and then propagates via this.

The other little nasty is harvesting address from Usenet and is supposed to be running on a few choice servers somewhere.

> wasted?

I don't see your point. Yes, Papyrus has bugs - we all are aware of
that. There are usually bugs *somewhere* in nearly every piece of
software I've ever seen. The trick is to find the program with the
fewest bugs, and bugs that least affect you. You go with the software
that works for you, and if you don't like a piece of software, don't
use it. But to say it's crap in general is not a good way to go about
letting people know you don't like something.

That's like saying, "Atari Falcon computers are crap" because they
don't let you use AGP graphics, have a SCSI bug, and the Tramiels
didn't care much about their customers. Those things might affect you
negatively, and may be absolutely true, but is it fair to call them
crap in general and advise everyone to use a different computer
instead, when there are a number of us out there using them very
happily without trouble? Does the fact that these problems exist mean
I shouldn't be using one in my music studio? In the same way, does
that fact that Papyrus has its problems mean that it's crap and I
shouldn't use it to create whatever documents I need, help create
quick, simple web pages, and keep track of my client information on
it?

Besides, my whole point here is: what software do we have that's any
better *and* is available *right now* in more than just German? If you
can come up with something, please let me know, because as far as I
can tell, it doesn't exist. For that point alone, Papyrus is worth
every penny they charge for it.

I saw this board once, I think it was on Jo-Even Skarstein's website. I was thinking of trying the DB50XG in the Soundblaster card of the Milan.

Opinion was divided over whether it would work or not but I think it will.

Worth I try but I couldn't even find one of these DB50s on e-bay.

If anyone could enlighten me about possible alternative midi cards compatible with the Soundblaster like the DB50XG I would be interested.

Regards,

Peter

Yep, hardwarebook.net has most Atari stuff. Strangely enough in the "Mouse" section the Atari mouse is missing. There is an Amiga mouse but that's different isn't it? Anyway I think all other Atari connectors are there, even the exotic Jaguar ports and the ST cartridge port etc.

Hardwarebook.net rules :)

IF I had started a CTTT, the CT60 would never be finished...because it was impossible to manage 2 projects in the same time...

And what didier did with TOS 4 modifications is not the same with TOS 3 ....

Who will modify and code in the TOS 3 to let him run on 060 ???

I don't know and because I dpon't know I can't start designing a hardware for TT !

That's a very simple situation !

No software -> no hardware !

In the same register, If I am sure that TOS or MAGIC can be run on PowerPC, I'm OK to design a new ATX mb with PPC.

The only mb I could do now is a Falcon 060 like machine (a CT60 in ATX format + PCI slots) because here I have no problems with software...

Hi Rodolphe!

There is the EmuTOS which would be pretty good replacement (no copyright
issues) for the TOS 4.04 in case of a new hardware.
The EmuTOS is now quite close to what the TOS 1.02 (or maybe 1.04) is
IIRC. Generaly it is working in at least 3 emulatros (e.g. supports all
the ARAnyM special features) Some people have already managed to run it
on real MegaSTE machive. (see the http://emutos.sf.net).

I think there should not be that a big problem to adapt it to TT or any
other machine and slowly develop the complete TOS 4.04 replacement.

Please, consider this possibility which is the only one offering
copyright free development. I admire you as a hardware guru that as one
of very few people is able to get things to be done.

best regards

STan

Sure, but of course the Commodore C16 was the best computer ever built,
no Vax, Cray or PentiumIV can compete with it.

(Note: I am being ironic). :)

6737. Open CPX modules from Taskbar's Start button

Newsgroup: comp.sys.atari.st
Date: 2003-09-25 11:48:08 UTC
From: maraka@atari.net
Message-ID: <d385a14d.0309250348.3c35b1d6@posting.google.com>
Source record: 23419

Hello

Taskbar 3 offers to open CPX modules from his Start button. But
depends what control panel i install it will open the module or will
not. For example with Cops or X-Control installed i am not able to
open the CPX module from the Start button, but with Z-Control i am.
The solution isnt use Z-Control because it makes my system unstable.
Any experiences with this?

More details: i use Mint 1.15.12 and N.AES 2.0

Thanks

David Galvez

Most PC 9 pin mono monitors can switch, either manually or automatically
between Grayscale (analogue color pins used) or Monochrome (TTL MonoChrome).
Atari's don't use TTL monochrome and these WILL NOT WORK. It will work in
grayscale mode only, i.e. in a color resolution with the Falcon <->VGA15,
then <VGA15<->VGA9 adapters.

Try the latest Z-Control, it has fixed some bugs from previous releases.

Z-Control is perfectly stable for me, but I use MiNT 1.16a.

Hello,

I would like to check if the docs I have about MVDI support (special XBIOS functions for Milan VDI) are right. To this end, I need the drivers themselves. These ones, when installed, add a cookie _VDI. If you have a Milan, and these drivers, could you send it to me ? Thanks.

I don't know why COPS doesn't work for you, but XControl won't work simply because it doesn't understand the AV-protocol. Can you please mail me some details on your setup? More specifically I need to know where COPS is located on your harddrive, where your CPX-folder is, what the COPS-binary is called and how COPS is launched.

The same here, Z-Control latest version works great on TT030 and Hades060.
On both machines I use freeMiNT 1.15.12/N-AES 2.0.0

Hello,

I have a atari falcon that I have just recased from a rack case and I unable to get the keyboard or mouse to work. I have checked all my connections, and chips, and they all seem secure and socketed. The connector cable on the keyboard appears to be slightly loose. Does anyone kno of a way to get a replacement connector?

I am worried that the problem might be more electrical in nature, and I am a novice at best when it comes to fixing that. I have just moved to the new york area and funds are tight to send it to one of the "offical" repair techs oput there, so I have a item for barter. It is a Tascam Tm d-1000 digital mixer in fair cond. The only thing wrong with it is that two sliders do not work, but the channel repsonds to midi. This is a good frontend for falcon recording setup if you have a spidf interface for the falc.

I am tired of looking at a falcon deskptop with no way to run anything on it. Any help would be greatly appreciated

Hi All,
Maby this will help (if these boxes are not filled to the limit!)
Note that my new address was not used to post with but this applies to all in this NG too!

From John Garone: RE: swamptax-NOT-@atlantic.net (without the -NOT- but dpesn't matter... it will be changed anyway)

VIRUS ALERT WARNING !!!

This message is being sent to the few people I sent my new E-mail address to this morning, 9/25/03.

One or more of your systems is infected with a virus that scans your mail box and sends mail to those addresses without you knowing it. My new box was filled in a very short time after sending my new address.
Most likely Outlook Express is your mail program and I'm told that systems hooked up to a dedicated line which lets Outlook Express stay open would be most suseptible.
So, whether you have a didicated line or not, PLEASE run the latest anti-virus program so mine and other's mailboxes aren't filled with virus attachments!
A new address has been set up and will be sent to you after you have some time to get your act together!!!

Thanks,
John

>Runs on my webserver TT.

I've probably received something in the same order, but I've given up emptying the 250 Mb GMX mailbox, it's like taking water to the sea, it fills up faster then one can empty it. I thought that we've had the worst behind us by now, but it seems to get worser... GMX has just send me a notice letting me know that the mailbox is nearly full again, considering that the largest part is already filtered away by GMX (nearly 2Gb in three days), this is a hopeless situation, so I've decided to leave it full for the next few days.

>>Besides, it's your mailbox which is being attacked, not this newsgroup...

>The question is: Why help these by answering questions in a newsgroup??

Hm, that's pretty radical, it's easy enough to filter anyone away using software from Microsoft ofcourse. I can follow your reasoning, but in the long end this won't do much good to this newsgroup and platform. What it comes down to is that you'll effectively silence about 30% of the posters here... and that's quite a lot. This newsgroup is more then just helping out people, it's actually one of the main Atari forums, IMO we can't afford to loose people because of this.

Cheers from Belgium

>>less a masochist, which is just fine by me.
>
>Or someone that is perfectly able to configure its system in a way it's
>perfectly usable.

Come again? Can you guarantee me black on white that nothing will ever affect
your system? There isn't one network administrator in the whole world who
would guarantee something like this. Setting up an invulnerable system on a PC
using software from Microsoft is an illusion...

>> As far as I'm concerned both these so-called mailers are spamming tools,
>> and from now on I'll treat them like this also, from october 1st anyone
>> sending me mails generated with that crap their mails will end up in the
>> GMX spam filters, this is a general notice BTW.
>
>How nice.
>I hope you will not feel too lonely.

I won't, there are about 100 people listed in my adressbook, only three of
them actually use Outlook or Outlook Express, making an exception for these
three is easily done. I realise it's not the most popular thing to do, but do
you have a better idea? I'm not a Microsoft user, but their software affects
my daily internet routine, I'm sorry for the people who use various software
from Microsoft, but I don't have to and won't put up with this nonsense any
longer.
BTW: have you thought about what the effect would be if everyone here follows
my steps? Instead of me being lonely, you'll be the lonely one. AFAIK nobody
is forcing you to use Outlook Express, what kind of very special feature has
that program that none of the odd hundred other PC mailers have? Anyway, you
know that using that program holds a certain risk, almost 90% of the crap
being spread on internet originates from that piece of shit. And I don't wanna
hear how many measures you took to not get infected, there's always someone
out there who's smarter, if your system isn't infected this time... no worries
it'll happen eventually. Well, I'm not going to have patience until then, like
I said, from the 1st october onwards all mail created by any MS product will
automatically be filtered away by my ISP. And I really do hope that a lot of
people follow my example, the more that follow it, the more you'll have to
think about using a different mailer. Using a different mailer means internet
getting a little safer...

Martin Byttebier couldn't have put it better when he suggested that someone out there ought to sue Microsoft. This joke must be costing ISP's all over the world fortunes... but in the end it's us the users who'll eventually will have to pay for it. In view of this I even suggest to take Martin's opinion a step further: all ISP's should at least triple their prices to people insisting using Microsoft rubbish, a bit like a car insurance, the higher the risk, the more you pay.

After reading your reaction, I'm starting to think along the lines of Kenneth, filter all OE posters away from this newsgroup may be pretty radical, but in the long end it'll give us peace of mind. There's more then one newsreader for the PC available, so you have the choice...

Cheers from Belgium
Dennis

Hi Maurits & John,

>>Ok. I'm kinda' folowing you! So where do I get "PPP echo request"
>>program?
>
>Well that's the difficult part, it's part of PPP so it should be in the
>ppp layer; you'd have to somehow tell it to send a request. I don't know
>which (if any) of the Atari layers has a function to do this. I'm sure
>they are all able to reply to echo requests from the ISP, but I guess
>they'd need some kind of function call in their API to send one and tell
>you the result.

This is why I advised John to give IConnect a try, but I didn't realise
that he was working under SingleTOS. IConnect can only run under MagiC
threading. So it's of little or no use, to him.

>Sorry I don't know the first thing about iConnect..:)

Well I do ;-)
The PPP echo request is part of IConfig, by default it's off, to activate
it, IConfig's PRO mode must be entered , IIRC it's located under the PPP
icon. The echo interval can be set from 1 to 9 seconds, and the results
are shown in the con_info.prg (Connection info).

Cheers from Belgium
Dennis

6755. Atari MegaFile Questions

Newsgroup: comp.sys.atari.st
Date: 2003-09-25 19:04:49 UTC
From: The MCP <the_mcp.NO.SPAM.@telus.net>
Message-ID: <I%Gcb.9740$AC3.336765@news2.telusplanet.net>
Source record: 23434

Just noticed that there are two new listings for Atari MegaFile Hard Drives
on eBay (items 3048607435 & 3048607442) in the past couple of days and
have a couple of questions for the folks in the know...

What is the largest drive is that you can put in one of these is (the
megafile 60 that is)?
And can you use the 88 meg SyQuest carts on the Megafile 44 with the
removable drive?

Thanks in advance.

Hi Rudolphe,

>IF I had started a CTTT, the CT60 would never be finished...because it was
>impossible to manage 2 projects in the same time...

Yes of course, I'm not blaming you at all, sorry if you perceived it that
way. I just wanted to let you know that there were a hell of a lot more
people then just that 25 you recall interested in that particular project.

>Who will modify and code in the TOS 3 to let him run on 060 ???
>
>I don't know and because I dpon't know I can't start designing a hardware
>for TT !
>
>That's a very simple situation !
>
>No software -> no hardware !

Ok, fine.... I understand.
I'm not a programmer and I don't know the first thing about designing mb's,
but why can't for example the Milan TOS be used, or even MagiC, Andreas
Kromke should be able to help you out in a jiffy, MagiC runs on a Milan and
Hades also after all. I presume that in order to get MiNT running TOS must
be patched first?

>The only mb I could do now is a Falcon 060 like machine (a CT60 in ATX
>format + PCI slots) because here I have no problems with software...

Yes, I've read that announcement. But unfortunately that is not the kind of
computer on my wish list.

Cheers from Belgium
Dennis

Indeed I can confirm this. Outlook Express 6.00.2800.1223 still has this
bug.

Hi!

Any Atari system is great in my opinion. You are an atari lover or you are not (I guess). But I have to admit I love my atari 8bit more than my atari 16/32 bit system. And I have to admit too: the atari 8bit is more stable than the ST, but that's more thanks to the software quality on atari 8bit, and has not really something to do with the machine. Unfortunately there are many TOS versions, and many different types of atari ST mainboard types.

>Increasing qsbchars, cqsbchars. mpipesize and sstack size (usually
>factor of is enough) solve those.

Tried this but unfortunately it didn't cure the problem. I still have this freezes. Seems to me that N.AES doesn't run correctly with the ct60. :-(
I also changed the power supply. The main goal was that my falcon should only have a single fan - me ;-) so therefore I bought a fanless power supply. As some of you noticed I also changed the oscillator on my ct60 so now it only runs with 60Mhz but also without a fan. :-)

Anyway, I am going to try XAaes so hopefully the freezes will stop.

Regards,

Frank

I recently had a look at StarFleet 1 from Insterstel Corp on the Atari
ST...I was expecting it to be better than the 8-bit -- boy was I ever
wrong...the 8-bit interface and navigation controls and targeting is much
more user firendly than the ST. Just tends to justify all that you just
said.

<snip>

Hi peter, are you using an external adapter? Have you tried the original
Keyboard? Sometimes with wear and tear the original falcon keyboard leads
will come adrift. I have in a couple of cases shortened and resoldered, this
should work if you are using free keys or something like that.

If you don't speak about the power of a 68000 versus a 6502 or 6510, ok ...

The fact is that the GREAT chips of the 800 and (more 800 XL) are better for sound and video than the ST !
I'm ok with that !

I think everybody knows here the story of the 800 and later the AMIGA that was vcreated by people that have something to do with 800 !
In Amiga they put the same technology bases ...and sure they attempted to let atari produce this new computer, but atari refused (an other stupid decision of atari !) and the guys went to Commodore and .....

I had a 800 XL and remember the powerfull of the CTIA / GTIA chip for mixing graphic & text modes with few lines of ASM code ! And how easy it was to add more colour by using the DISPLAY LIST doing an Interrupt of the Display list...
These technics are on Amiga.... not on ST that is very poor for video and audio...

>
>Galen

I also had problem when I installed HDDriver onto my STe with ICD
formatting. I eventually had to repartition the drive using
HDDriver. Now it works better than with the ICD software.

I would copy the HDDriver program file (goes in the auto folder)
and the HDDriver.app file onto a floppy. Boot the Falcon so that
you get a plain screen. Run the program file, then the app file.
You should then be able to install a new HDDriver.sys file on
partition C and it should boot up. You may want to take off your
data, re-partition it using the app program and but everything
back on the hard drive. Did that with my STe.

>
>I'm going to do this (using 30 pin SIMMs) ... any directions ?

Well if your STf takes simms, they just snap right in. I have a
1040STe that uses simms. The motherboard has the simm sockets
built right in. I did not think the STf has such sockets.They may
be a piece of hardware out there that allows this.

>
>And another question..

The author, I believe using Magic as his OS. I use Magic, Mint and
Geneva. Under Magic, Taskbar has no problems opening a CPX file
under the COPS.acc program.

Hi, Edward!

Sorry to tell you that these two don't exist any more...

ESBJ> http://www.mcc.ac.uk/~dlms/ftplinks.html
ESBJ> http://rzserv2.fh-lueneburg.de:8080/Atari_1

But you can try the wayback-machine at

<http://www.archive.org/>

Only for Atari 8-bit computers:

ESBJ> http://www.atariworld.com/

Try <http://members.tripod.com/~TT030/> for:

ESBJ> http://members.tripod.com/~TT030/tt.htm

Always glad about some "new" Atari links ;-)

Regards,

Alexander

Yes your're right : ANTIC !

And is everybody knowing that Player missiles was the first name of the Sprites !??
In fact commodore never invented the sprites !
Atari did it before commodore ! The player was a sprite and a missile (a small ball) was associated to each player !
4 player-missiles if I well remember, in the 800 XL.

>is an Afterburner. Both have a NOVA and Expose installed. Still not
>sure which one to install the CT060 on. Both are compatible/reliable,
>with the 030 Mighty Sonic being slightly more so.

Well. Due to the fact that the NOVA doesn't work with the ct60 at the moment
I would recommend to remove the Mighty Sonic. The ct60 is absolutely stable
and if you have some elder programs (mostly demos or games) you can even
switch to 030 mode to have an old F030 :-)
In this case you should try the solderless installation. :-)

>>compared to my afterburner setup I had before) in raw cpu power (~
>>factor 2-3) is so dramatic that I wouldn't go back to my "old" falcon. :-)
>Decisions, decisions.....:)

You still have your second falcon with afterburner and NOVA. :-)

Great to hear that it is moving forward! What I was trying to say,
though, wasn't that it will never come out, but that to this point
English users haven't had any real choices other than Papyrus, and for
most general things that I do, it works very well. Another way of
putting it: Let's say I have a project that must be done by next week.
What else am I going to use other than Papyrus, or a Mac/PC
substitute? On the Atari, I (and other English-only users) can only
choose either Papyrus (with all of its apparent flaws), or much older
word processors with much more puny features, thus limiting my
creativity on the project. For this reason, Papyrus *right now* is the
only option, and well worth its price. Sure, if Tempus Word comes out
in a couple months, that might be the best option. If nothing else it
gives us more of a choice. I'm not saying that Tempus Word is bad, or
isn't worth the wait. I'm saying that Papyrus shouldn't be called bad
necessarily, either, and that it *can* be well worth the price if it
works better on an *individual basis*. What's best for one isn't best
for all.

Hello!

> I'm not a programmer and I don't know the first thing about designing mb's,
> but why can't for example the Milan TOS be used,

It's still copyrighted and the Milan GmbH only have the right to modify
and distribute it for the Milan.

> MagiC runs on a Milan and

Just a note, MagiC on the Milan also use the MilanTOS BIOS routines for
console, serial port, floppy I/O (MagiC don't include Milan specific
hardware drivers).

> Hades also after all. I presume that in order to get MiNT running TOS must
> be patched first?

FreeMiNT don't include native console drivers and use therefore the TOS
BIOS driver (same for floppy, but there is an driver in progress). Also
FreeMiNT don't include hardware initialization yet. If you put these
things into the FreeMiNT kernel you can get rid of the TOS dependency. I
think this is much easier as to port/patch the TOS.

Ciao
...Frank

I'm sorry, but I don't see _any_ piece of software on _any_ system that can
provide such a guarantee.

The only thing I can say is that I'm using OE and IE since I dropped
Netscape because Communicator was such a piece of crap... and that I never
get any virus.

Perhaps also would you feel more confident if I add that I have the licence
of my Windows 2000, that I apply security patch both for system and
application when they are released, that my antiviral software is also
autopudated, and that I also have a firewall that filters all unsafe
attachments...

I sincerly don't see what you found bad in my reaction.
You just wrote that from now people using OE are kind of "masochist
bastards" (I used you words) will not be able to communicate with you, I
just replied that not everybody using OE is masochist or a bastard...

Hi All,
Just as fast as it started, the bombardment of my new mailbox has
suddenly stopped!

Scenario:
After killing my original address, it started to happen again at my new
address immediately after I notified 15 people of the change. So I set up a
test address here and mailed each of the 15 one at a time while waiting a
period to see if the new test address got bombed. Never did. But in the
2 days after sending the first notice to the 15, two of those addresses are
no longer active!
My deduction is that the offending mailers changed their addresses
(and hopfully ran a legitimate anti-virus program)!

John

Hi Mike,
sorry to respond in reverse but you started it :)

you might be right about software that detects certain words and once
they get your real address it's permanent!
Out of curiosity I re-installed an old address at my website to see if I
would get mail from people who didn't know I had changed the address and
instantly got a ton of crap!

For those who don't know, never respond to an email ad to remove you from
a list. Then they know your address is good and you get passed on to more
lists! Also, never check out a site mentioned in an E-mail unless you
asked for it. Your address could be incorporated into the sites URL
(may be disguised). Just browsing that site with a cut'n paste or extracted
url from the mail will get you on a spam list.

In regard to my post below, I'm guessing that the offending system ran
an anti-virus patch or one of the two mails that were returned as
undeliverable (out of the 15 I resent) got shut down by it's owner with
the other returned due to an over loaded mailbox! Note that the address
was a new one so my ols address might still get slammed if active!
Anyway, knock on wood, the virus attachments stopped!

>There is a lot said about using your "real" address in usenet and

Hi,

I'm looking for a Parallel-port-drive driver called HDD-Daemon, wich may let me use a PC HDD on my Atari 1040STfm, using a special parallel port cable. Does anyone have it? Is it good? It seems the be the only option I have since it's impossible for me to find a SCSI host adapter or something like that....

Thanks for all!

Facundo

6789. Adamas/Draconis/Drac-emu/STing using EtherNec?

Newsgroup: comp.sys.atari.st
Date: 2003-09-27 21:09:25 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3f760a5a1425d00@tripnet.se>
Source record: 23370

I'm trying out the Adamas browser using a STinG setup with the Draconis emulator. I'm on a LAN with EtherNec and a "broadband router" with NAT connected to the Internet.

Using Adamas strictly locally on the LAN I can surf to both the Weblight webserver on another Atari here and a pc running Debian/Apache. But as soon as there is a single link to the outside with a named url (a counter for example) Adamas goes down. If I try to enter an external url it goes down right away.

Apart from that Adamas seems to be quite a nice browser but useless to me at the moment...

When I try to Ping other hosts with DRACPING.PRG I get response from all computers on my LAN including the router. If I Ping any outside numerical address I get no response at all! Judged by the lights on the router the Ping packets does not even manage to go through the NAT of my router and out on the Internet. Resolving works OK as there is a DNS proxy in the router.

All native STinG clients work like they should.

Has anyone managed to Ping an outside host using Draconis on a similair setup?

I find it interesting that Adamas crasches on all external sites but not on local 192.168.0 LAN sites and DRACPING.PRG fails to reach the same sites.

Hi All,
How much of a header can be forged? It seems to me you can't forge the
IP #s which the post or mail passes through so shouldn't they be traceable
back to the real source?

John

I grew up on the Atari. Quite possibly the single most item that I grew up on in my youth. I hear so many things about Atari and the complete screw-ups that they made and I am so ashamed by it when I hear it. My Atari computer was a part of me, and in that respect, so was the company.

When I had heard that Atari once laid off its entire factory to move overseas, I couldn't find a hole deep enough to crawl into. Turns out that it was one of the biggest and most breaking mistakes that they made. Atari was truly run by firstly, a management that made some mistakes, and secondly by a management that did not care. I only wish I could do something to correct those mistakes.

I remember back in about 1983 when suddenly the games that ran on the Atari were quickly becoming few and far between. You literally had to search for places that stocked them. Then, later, I heard they stopped supporting the Atari 800 all together to bring about the ST. My heart nearly stopped as I had felt that I had been abandoned by a part of my own self. How about that mistake they made by rushing the construction of the "E.T." game and making way too many of the poorly constructed game that they ended up having to bury thousands of cartridges, the same game that they said would make the movie famous.

There is so much that Atari COULD have done that would have saved its ass. I ALMOST (not quite) wish that I grew up with an Apple or a Commodore. (ouch, that hurt)

I am curious, does anyone have some old copies of the Stock Reports that Atari was required to make when they were selling stock on the NYSE?

Any header in a mail can be forged, with the exception of those inserted
by the last server to handle the mail (should only be a Received:
header, but some broken clients don't insert a Date: header). In
general, these are going to be the ones added by your ISP, or your own
server if your running one.

Here's a tutorial on how to read headers:

<URL:http://www.stopspam.org/email/headers/headers.html>

Google throws up a few more links with this:

<URL:http://www.google.com/search?q="help%20reading%20headers">

Searching Google groups should turn up a few more, but it looks like
Google groups has a problem with memory. It seems to have forgotten
stuff from the last 4 or 5 years :|

I think not the driver is install the new XBIOS function. It is the MilanTOS. I can't see that they make a new trap. No one of the driver use one of this function. The ATI driver use a XBIOS function 159. But I have no info about that.

I ask two person about this XBIOS calls, without success.

6804. MEG spamfilter "friends" question

Newsgroup: comp.sys.atari.st
Date: 2003-09-28 16:09:04 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3f7715a419a8000@tripnet.se>
Source record: 23386

The MEG spamfilter from http://membres.lycos.fr/nef/ is running 24/7 here since a week and does it's job quite well. Only got two "hangs" when MEG freezes showing "Checking" in the main window. Might be STinG related?

Other apps still runs fine in parallel but MEG has to be ended the hard way...

Now I'm trying to refine the filters but as soon as I put anything in the "Friends" list my other filters stop working!

Sofar I only filter out the SWEN virus with these filter rules:

'Body' has: <iframe src=3D"cid:
'Body' has: , Cumulative Patch" update whi
'Body' has: <iframe src="cid:

I'm uncertain what the fields in the "add Friends" dialogue really does. Will it filter from the Name field and what is "Nick" and what is it used for?

If I enter one single "Friend" with a name, nick and one email address the body filters above does not work anymore. Am I doing something wrong or is this a bug?

> In Amiga they put the same technology bases ...and sure they attempted
> to let atari produce this new computer, but atari refused (an other
> stupid decision of atari !) and the guys went to Commodore and .....

This is one version of the story.

There is another version:
http://groups.google.com/groups?hl=en&lr=&ie=UTF-8&threadm=
3dbd90ee.1906364807%40news.jersey.net&rnum=1&prev=/groups%3Fq%3Damiga%
252Batari%252Btramiel%252Bloan%252Bhaynie%2Bgroup:comp.sys.amiga.misc%26hl%
3Den%26lr%3D%26ie%3DUTF-8%26selm%3D3dbd90ee.1906364807%

which is much more likely to have happened

Atari thought they could have it cheap, and CBM took advantage of that.

Bonjour :)

Upgrade of Meg, mailbox checker and antispam filter.
Download on my homepage or directly -> meg12_uk.zip (230 Kb)
at http://membres.lycos.fr/nef/files/

Changes:
- bugfix of 'Save' item menu : now active
+ alert to save datas when leaving (if datas have been modified)
- bugfix in 'To + Cc' string search (was searching only in 'To')
+ optionnal case sensitivity for string search
+ new type of 'friend' : mailing-list (Email3 is deprecated)
-> declare a mailing-list, so you can use the 'To + Cc' is not for me
and keep mails coming from this mailing-list
+ New size filter : range of size (>=X and <=Y). If you want to delete
all mail with size (>=X), use only the first numeric field.
+ Spam size is notified in the log file
+ Total size of mails is indicated in a bubble upon the icon
(only if bubble deamon is set)

Regards

Rajah Lone / Renaissance

Thanks for your efforts!

>Changes:
>+ alert to save datas when leaving (if datas have been modified)

If I click on the window close box this alert does not appear. Works fine
if ended via the File menu.

>+ optionnal case sensitivity for string search

Hm, when I checked this feature my body filters stopped working when
there should be an exact match.

It seems impossible to use body filters combined with Friends entries?
(Body filters stop working)

Bonsoir :)

On 28 Sep 2003 16:09:04 , "Kenneth Medin" wrote:
> Only got two "hangs" when MEG freezes showing "Checking"
> in the main window. Might be STinG related?

I saw also this, when Meg could not connect to the mail server.
"Can't connect to ..." instead of "+OK smith mail server"
The received message does not contain a carriage return or
line feed, so the program is stuck in an endless loop.
The 1.2 version try to detect the "Can't" to exit, but it
may not work with some server (with "Cannot" :/)

> Other apps still runs fine in parallel but MEG has
> to be ended the hard way...

You can kill the program/process, it's safe. No write nor
read on the hard-disk during checking and spam-deleting.
The log file is written only at the end of the check.

> I'm uncertain what the fields in the "add Friends" dialogue
> really does. Will it filter from the Name field and what is
> "Nick" and what is it used for?

If the friend is not a mailing-list, the 'From:' is taken and
all the friend fields are used for a search in the 'From:'. If
one of the field is found (not case sensitive), the mail is
always accepted and the spam-filter is not used.

If the friend is a mailing-list, the 'To:' is taken.

> If I enter one single "Friend" with a name, nick and one
> email address the body filters above does not work anymore.
> Am I doing something wrong or is this a bug?

I'm not using the nickname... Maybe this is why I didnot see
it. It may be a bug, I'll inquire ;)
Try to add more than one friend.

Regards

Pierre

Okay, so what's useful there. Not much I'm afraid. If you want to report
someone then this is the line...

atlantik.net ([80.4.128.70]) by mta03-svc.ntlworld.com

...and ignore the textual address. As you can see that's bollox as well.
It's the IP address you're after...

$ nslookup 80.4.128.70
Server: cache1.ntli.net
Address: 194.168.4.100
Name: m70-mp1.cvx1-a.not.dial.ntli.net
Address: 80.4.128.70

...and a...

$ whois 80.4.128.70
[snip lots of stuff]

...ought to yield an ISP address to report it to. You don't need these tools
on your machine: there's plenty of web based ones. Note that there's a clue
in the above "Name:" that its a dialup account & therefore pretty certain
to be on a dynamic address. You need ISP help to discover who was using
that address at the time of the abuse. However, if it does happen to be a
fixed address then you're laughing so to speak 'cos it identifies them
directly.

That's good and makes the risk of lost clusters minimal.

Just the three body filters alone works fine. If I add one or several
friends all the SWEN virus mails get past the filters. Should be easy to
test.

>Try to add more than one friend.

Did that too and also put in more than one email address.

Is the Nick entry related to ICQ in some way?

>and distribute it for the Milan.

Well let's be a little creative then;-)
Milan GmbH only has to take one single minority share in the project, and
then the copyright nor the distribution rights are violated anymore. It's a
common widely used practice.....

>> MagiC runs on a Milan and
>
>Just a note, MagiC on the Milan also use the MilanTOS BIOS routines for

I know all this... I wasn't referring to MagiC-Milan but to MagiC and the
patched MagiC for the Hades.

>>Hades also after all. I presume that in order to get MiNT running TOS
>>must be patched first?
>
>FreeMiNT don't include native console drivers and use therefore the TOS
>BIOS driver (same for floppy, but there is an driver in progress). Also
>FreeMiNT don't include hardware initialization yet. If you put these
>things into the FreeMiNT kernel you can get rid of the TOS dependency. I
>think this is much easier as to port/patch the TOS.

It might be easier then to port/patch TOS, but it severely limits the user
his options, it's no secret here that I'm a MagiC fan, will MagiC run on top
of the FreeMiNT kernel?
Let's put it differently, or otherwise some people might climb on their
horse again:
Supposing that the TT-60 project would be persued then I would expect to be
able to run on the expanded TT the same stuff as I do right now. If the CT60
board for the Falcon would only have been able to run a single specific OS,
I think that Rudolphe would still be stuck with a lot of boards...

Cheers from Belgium
Dennis

Hi Mickael,

>I'm sorry, but I don't see _any_ piece of software on _any_ system that can
>provide such a guarantee.

Neither do I, but since the MS OS and software is the most widely used it's
also the most targetted by hackers and virus creators, so people insisting to
use MS software are the most vulnarable.

>The only thing I can say is that I'm using OE and IE since I dropped
>Netscape because Communicator was such a piece of crap... and that I never
>get any virus.

Good for you, unfortunately there are at least 100 million other OE and IE
users out there, I've been tolerant, but enough is enough...

>Perhaps also would you feel more confident if I add that I have the licence
>of my Windows 2000, that I apply security patch both for system and
>application when they are released, that my antiviral software is also
>autopudated, and that I also have a firewall that filters all unsafe
>attachments...

Have you any idea how may times I've heard that song before? I still have to
see a PC user admitting that he's running an unsecure system, you guys all
take the necessary precautions... unfortunately in practice it's different.

To be blunt: I don't give a damn. This last tidal wave has been the last
straw, I'm fedup with MS and their fanclub. Apply security patches as much as
you like it won't do any good. Those patches are always released after the
damage has been done, same thing for anti viri, in order to create them, the
viri must first be discovered, and then the damage is already done. These
measures are usefull to stop the viri spreading, but it doesn't prevent them.
It has nothing do do with feeling confident, it's pure common sense. Since
last week almost 85% of my mail sent to people who don't have a PC and don't
use MS products bounced back. I can only guess how many mails adressed to me
bounced back because of my mailbox being constantly full... I don't have a
grunge with MS users, you can all exchange the biggest crap for the rest of
your life as far as I'm concerned, but when it affects me then I'll take
measures... IMO the best measure is to filter out everyone who mails me using
a MS product, it costs nothing and it's a hundred times more effective then
all your security patches, antivirus killers and firewalls put together...

>I sincerly don't see what you found bad in my reaction.
>You just wrote that from now people using OE are kind of "masochist

>bastards" (I used you words) will not be able to communicate with you, I
>just replied that not everybody using OE is masochist or a bastard...

Oh boy... you really don't get it do you?
Instead of admitting that MS software is a security risk, you defend it, and what a timing you have... it's not exactly the best moment right now to come raving in here about OE and/or IE. Have you noticed the number of posts of people here reporting what havoc your software by choice has caused? Have you also noticed the number of usual posters to this group who are absent this week? Any idea why? I thank my lucky stars that I've got a flat fee DSL connection, people with a pay by second dial up connection must be scared to death when their phonebill arrives, and all this is caused because YOU and another zillion idiots don't want to know and hear that using MS software is a security risk. As long as you guys were infecting each other all was fine by me. But why should I (we) have to suffer because you insist on using that crap? Is anyone out there holding a gun pointed to your brains forcing you to use OE and IE?

Cheers from Belgium
Dennis

Any drive that's compatible with the interface. But I don't know what
interface the megafile 60 uses.

> And can you use the 88 meg SyQuest carts on the Megafile 44 with the
> removable drive?

Not with the same drive, that's why it's called Megafile 44. However,
the megafile 44 is nothing more than a casing with an ASCI-SCSI
interface and a Syquest 44MB drive. So if you can find the 88MB drive
somewhere, you can simply replace the drive. You can also put in any
other SCSI-1 harddisk if it's not too large or too new. :)

Maurits.

Yes and no. You can't do anything about the headerlines added by the
mailservers the mail passes through, but there are two snags:

1. Some mailservers don't add these lines (although they will usually
not be "real" mailservers but lame open relay daemons ran by
unsuspecting broadband users who installed some toy server)

2. You can add fake lines at will.

Point 2 can mean that the real sender is somewhere in the middle.
Combined with point 1, it can make the mail pretty difficult to trace.

Maurits.

I have realized that Z-Control was the only one woking because it was installed as an application under Thing (Menu Extra-Application) to open files with the mask *.cpx. I have done the same with COPS and now it works. But i thought that this wasn't needed.

I have tried the last version of Z-Control the last weekend and still
get crashes. This crashes comes when i'm typing with an editor or
from the console. I think that what freezes is NAES, i'm able to move
the mouse but nothing answer (button, menus....). Keyboard seems to
work as i can reboot with Control+ALT+DEl. At the beginning i thought
that could be an CT060 issue but i got this problem also in 030 mode.

I have no problem while using MiNT 1.16a with N.Aes 2.0 and latest Zcontrol.
(I also use NVdi 5.x). I think that some other software that you are using
is causing problems.

Bonjour Kenneth :)

> Just the three body filters alone works fine. If I add one or several
> friends all the SWEN virus mails get past the filters. Should be easy to
> test.

Well, not easily on my mail account now. Seems my internet provider has put
an AntiVirus on all mails accounts and I have no more W32/Swen. I will build
some auto-mails with the strings/rules you have declared.

Also, can you mail me your FILTERS.MDB and FRIENDS.MDB for me to inquire ?
Thanks.

> Is the Nick entry related to ICQ in some way?

No, just a nick your friend may use, so it may help is some cases if he has
changed his old email to a newer one, without telling you.
for exemple:
nick = superboy
old mail = superboy429@hotmail.com
new mail = superboy@atari.org

difficult but still possible then! I would think that any ISP should be
concerned about their customers or their servers getting loaded with
crap and could dedicate a person to tracing these idiots! My ISP falls
short in that respect (and it's filtering methods). I shouldn't have to
rely on programs like MEG (however nice a program it is). Maby ISPs
should get together to fight the problem but I don't see that happening
either! Guess the only short term solution is a fake return address with a
new real one (as I've been doing) and don't mail to someone you don't
know is keeping their system clean (and don't forget to use the fake one
as I did recently /:)

Nevermind...
i found it...

I was reading...
And off course, you will need a bi-dir parallel port..
(But, all newer computers are equipped with, at least , one)
The problem, is to build the cable.
nothing else..
I'm going to build it, and posting comments..
:o)
Anything you can reach me at mail

Greetings

No importa,
lo encontre

Estaba leyendo,
y claro, necesitas un puerto bi direccional
(Pero todos los computadores nuevos, tienen al menos uno)
El problema, es construir el cable.. nada mas.
Lo voy a construir y contarte como me fue..
Quizas nos podamos ayudar en eso
:o)
Para cualquier cosa, me puedes ubicar al correo

Saludos

6840. Getting an STe running again...

Newsgroup: comp.sys.atari.st
Date: 2003-09-29 20:14:47 UTC
From: Mamba <a@b.com>
Message-ID: <bla3rq$6qo$1@news2.tilbu1.nb.home.nl>
Source record: 23322

Hi folks;

while cleaning up my modern multi-media computer I sifted through some floppies, and I found something I had not seen for years... some disks with letters I wrote to my (now) wife, when we were trying to get married. Her being in China, and me in the Netherlands, that was quite an udertaking 20 years ago....

We did not see eachother a lot, but we wrote letters. Lots of letters. I had bought a Sharp MZ80K, but traded it in for a Schneider CPC128, on which I wrote all my letters to her. The Schneider had a rather peculiar floppy, a 3", on which I stored the letters.

Then, finally, we got married, and after a while I bought an Atari 1040ST, and when the Mega St/e came on the market, I bought that one. In the Atari magazine I found an articcle on how to use a special parallel cable and a tranfser program to transfer files from Schneider 3" floppy to the Atari. I used that one to transfer all my letters to 31/2" (single-sided) floppy, because i wanted to keep them, as you may understand.

So, yesterday I found those floppies again... but my current computer cannot read them anymore...

Next thing I did was to dive into the heap of rubble I keep in my attick. To get my Atari Mega St/e, that I last saw perhaps 13 years ago...

It is here on my desk now, and monitor, TOS and the internal and external floppy all work well. I found tons of floppies with programs, and the letters are being transferred to double-sided double-density 3 1/2" floppies formatted under Window, and then to my hard disk. Funny that a 20-page letter can be stored in a 43 kbyte file..... One day our two sons may want to read them..... ah well.....

ANYWAY.

I do have a question to ask. That ST/e, it is on my desk, and I do not want to bury it on the attick. Not for a while at least. There is a 48 MB hard disk drive in it, which I tried to format and partition. I found the floppy with the Atari Advanced Hard Disk Utilities, and the manual, but though the systems seems to work well I cannot format the hard disk anymore. I start the computer, put in the floppy and start [hdx.prg]. Then I select Disk / Format, and after the warning I select Unit 0 (the only option available) in the menu < select the physical unit>

It sould work. When I boot the system, I see the Dard Disk light come on, the disk rattles and hums. Also, when selecting < Disk / Format> the disk light responds, and I hear the disk rattle. But the message I get is: { The

physical unit you have selected does not exist. Click OK to reselect]

But the unit is there! I know, for I broke the warranty seal (yes, I did!) to have a peek. It IS there. I dis/reconnected all connectors, but to now avail.

Now I just wonder what I should do. Is there a site where I can get more sophisticated disk tools? Is the drive too old? That lithium battery may have given up, has that something to do with it>

Now I am sure there are guys on this forum that know how to get the old dog running once again. As you may understand I cannot get rid of this antique thing, not without at least giving it a good try.

So please.... any suggestions are welcome. Sites with info, downloads of new driver disks, I know there are hundreds of them. Any links.... very welcome over here!

Thymen

Message-ID: <bla48s$1g1$1@reader2.panix.com>
Source record: 23323

My two cents worth is not worth that much. I use a TT, and do not use Taskbar.

To have different CPX files for MiNT and single TOS, I ended up using Xcontrol, said to be buggy, with MiNT, where it so far has caused no problems, and Zcontrol with Single TOS, which so far has caused no problems. Anything else did not work for some reason or other.

Some of those problems may be aes or desktop related, and involved not being able to reload CPXs or not being able to change the CPX path from the desktop. That is why I wound up with two different control panels.

MiNT 1.15.12, NVDI 5.x, Teradesk, Thing, Xaaes. Will try N.AES as soon as possible. I seem to have bought a weakly recorded CD, which gives random install errors, on two machines, with two different CD ROM drives. Somebody has a good one and a CD burner, and I might achieve nirvana any day now.

I would strongly suggest finding SuperBoot. I have buttons for a clean boot, and a clean boot with the MiNT kernal. If that makes problems go away, there is an order problem someplace.

Jim

Same problem here : CT60/66 MHz, 256 MB, 800x608x256, bus @ 20 MHz.
Colour images (I tried both TIF and GIF, both 256 and TC) aren't
displayed, but monochrom and IMG do!
I thought it was because of the colour patch I use for Calamus, but
removing it didn't change anything.
Just try and catch this nasty bug ;-)

Regards,

J.-Luc

From the mail you sent me (which I haven't been able to reply to yet) it looks like you're using WDialog. Don't. Use N.Dialog, and the Copsload-program from my homepage (http://atari.nvg.org/) if you want to run COPS. Works perfectly on my Milan.

It shouldn't. I'll have to take another look at this code when I get my
Milan reassembled.

I got it to work with my Lan using MagicNet. Have not tried the
Mint side, but I would guess it would work also....

On my STe I use HDDriver and it everything works fine now. I
replace all my ICD software and used HDDriver to reformat the
drive. I would suggest going to Uwe Seimet's homepage and
downloading the HDDriver demo. It just may work for you also....

Obviously. :)

Does this work the other way around too? I have a CPC and can download
all the old CPC games from the web, but have no idea how to get them to
my CPC. (Ok the CPC can connect to the net as well, using a package
called "CPC/IP" but try to find a serial interface for it these days) :)

Maurits.

I don't understand you. Milan GmbH don't have the right to publish sources
or let other parties parties freely develop on these sources or distribute
it for non-Milan computers. I don't see any space for creativity.

It's just the problem you can't port MagiC to a new or different
68k hardware. You are always limited to the ATARI ST/TT/Falcon layout.

6854. [UPD] October Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2003-09-30 10:22:28 UTC
From: Francois LE COAT <lecoat@lutece.net>
Message-ID: <3F795964.1040300@lutece.net>
Source record: 23335

Hi,

The software "Eureka" is updated and released on its WEB page.
It is a "2D Graph Describer and 3D Modeller". It is updated
nearly every month, if I found significant improvements for it.
You will have to fetch it at :

http://eureka.atari.org/eurka310.zip
That is the Complete Common Edition

http://eureka.atari.org/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.atari.org/eurka020.zip
Is the Complete 68020 Edition

http://eureka.atari.org/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.atari.org/lib_dgem.zip
Are Dynamic Libraries Extensions for Eureka

http://eureka.atari.org/tiny044.zip
Is the OpenGL Extension (requires previous package)

The update consists in corrections and improvements
in speed. Beware that for a guided visit, the
RECORD.ACC accessory must be also updated.

I wish you big fun with all this new STuff !

Best regards,

-- Franï¿½ois LE COAT
Author of Eureka 2.12
http://eureka.atari.org

> don't care

That was uncalled for! It might be good if you showed some better
manners as well, especially since the person you replied to is very
likely *not* the person you think he is. If nothing else an apology
might be in order. Might be good to check e-mail addresses before
posting, too. Or, do like I do, and take each post as a separate
entity. If the person you are replying to uses bad manners and bad or
abusive language in their post, deal with it then if you want, and
then let it go. If they later post sensibly, then treat them with the
same respect that you would treat anyone else. And since there are no
doubt a number of similar, or even the same names floating around here
from time to time, it might be safer to just assume the best instead
of the worst.

Well..... better not fire up your soldering iron yet. There must be a way,
but I am sure I threw away all the info on how to connect the CPC128 to the
Atari. My CPC is still here, but it is totally broken. Scrap.

As far as getting the hard disk running.... I opened the case and checked if
the HD still spins. It does. Checked all connectors. No help. I downloaded
Uwe Seinmeths demo program, but it does not allow for formatting. And I am
sure that, if there is no hardware failure somewhere then the standard HD
tools supplied with the ST/e would do the job.

I'll shop around when I have time. Will report if I find a solution.

Thymen

Hi Frank,

>I don't understand you. Milan GmbH don't have the right to publish sources
>or let other parties parties freely develop on these sources or distribute
>it for non-Milan computers. I don't see any space for creativity.

Who said anything about publishing sources or free development? :-/
Milan GmhB have the right to distribute and/or sell a modified TOS for their hardware. I doubt very much that the contract stipulates what exactly a Milan computer is... so if Milan would actively support the board, say by adapting the TOS, they wouldn't really be violating anything, theoretically speaking one could say it's a Milan board III....
Rudolphe his problem would be solved and Milan would solve a little of their cashflow problems, it's a win-win situation.

>It's just the problem you can't port MagiC to a new or different
>68k hardware. You are always limited to the ATARI ST/TT/Falcon layout.

Sure... but then SingleTOS is not exactly FreeMiNT either, so what you are actually proposing is to drop support for SingleTOS and MagiC. Some people might settle for one out of three, but I rather like to keep al my options open.

Cheers from Belgium
Dennis

Never figured that perhaps I _liked_ using Windows, OE and IE ?
I can't bear Mozzila, and Opera, and I think that Eudora sucks probably as
much as Outlook (not express).

I don't see why I should use what I personaly consider as beeing user
unfriendly software.

I would be very happy to replace OE and IE by safer alternative, but I don't
want, and will not, sacrifice user friendlyness for that.

This should work. As I understand it, you select to format your hard
drive and it hums awhile, but then you can't find it. Did the hard
drive work before the format? Give us some information about your
computer, if you please.

unless I misunderstood (which happens to me frequently here :) it seems
to work for Dennis and whoever else wishes to filter mail sent with OE.
I don't think he meant that boycotting OE was a way to get it improved but
rather a personal way to avoid crap! The masses boycotting is highly
unlikely in a group where most don't even know what anti-virus software is
(group meaning pc users not this newsgroup :). A friend told me: "nah,
I don't need to run it, I'm ok!". Reminded me of some leaders evaluations
after Poland fell in WWII !!!

>
> --

I dont know about another software but may be the hardware. Yesterday i run only the MiNT kernel 1.15.12 and N.Aes 2.0 nothing else was running no NVDI, no accs, etc...., from N.Desk i started Z-Control and opened an editor QED or Luna after typing for a little while N.Aes freezed. Then i intalled Xaaes 0.970 and the problem was gone. Something very similar to this happen to me also with ST-Guide, when i scroll the ST-Guide window using the arrow keys from my keyboard (no problem with the mouse) i get the same kind of freezes, it doesnt matter the mode 030 or 060 and only with N.Aes.

Do you know where can i download the Mint 1.16a kernel binaries? To do some more tests.

I know that i can use some other applications like COPS as a control panel or HYPVIEW as a guide viewer, but i would like to know why things that work for others dont work for me.

Message-ID: <3f7ab471$0$20618$626a54ce@news.free.fr>
Source record: 23252

I just tried the new E41J mask REV 6 060 !!

Run at 72 MHz easy (32°)

Run at 80 MHz easy too (33°) !!

You well read : My CT60 runs at 80 MHz and all is stable !

With ABE 5K and SDR 5D !

The speed is crazy !!!!

I put bench this day on my web site !

I asked to the furnisher how much CPU he could sell me and I will propose a upgrade to people who want the new 060 !
People who have already bought a 060 to me will have a very small price (no benefits from me).

This mask is surely more thin and so internal timings are better ...
The essential problem was caches timings inside...
NO more problems !

now I have a big problem : will the PCI bridge run at 80 ??? hum, it is a 66 model...

I have to find a solution...

The 060 with the last mask is really an extraordinary CPU !!!

Regards

6873. CT60 at 100 MHz !!!! I'm deadly crazy now !

Newsgroup: comp.sys.atari.st

Source record: 23253

My CT60 RUNS AT 100 MHz !!!!

YES !!

I don't believe that !
I boot , see the 65K color picture and see the SDRAM test : 103.7 MB/s
(argh !)
And I see the boot of the HDD with F30 bus at 25 MHz !!!

And I see the desktop !!! ARGHHHH!

I go immediatly in the CT60 CPX to see the temperature and : 35°C and 36°C
after 2 minutes !!
No crash....
It's a dream ....

Guys the hades 060 is now so small !

I quit CPX, thinking it will crash in few seconds...

No crash !

I run Z-Bench , ok, run CPU test : 777% from CT2 wouf...HADES 060 is 409 %
and Power Mac G3-300 MHz is 1145% ONLY !!
I run FPU test : 27252 % from CT2 - Hades 060 is 13798 %
Graphics : 551.8 %
Disk : 145 % with Quantum Fireball CR 4.3GB
3Dopen GL : 552.4 % - Hades is 1411 with a graphic card (eh eh).

ah ah ah
I just becoming crazy.....

Hey, I'm very proud because my ABE and SDR logic is very very well designed
to support 100 MHz !!!
;-))))

OK, now...we get an atari at 100 MHz !!!

OK I have to go out of my house and take fresh air ! I need !!

I love E41J mask !!

Hello all!

I've been trying to overclock my falcon mobo to 20MHz but with problems. I updated my CT60 hardware with JTAG and replaced ST-ram card with atari 1mb. This solves most problems however there is still present a problem where in 20MHz mode, the keyboard and mouse are garbage (mouse moves as keypresses), keyboard presses as wrong keys! In 16Mhz it works fine so it can't be my wiring/soldering right? Any suggestions? Should I redo my solder joint to that ACIA? Also note, none of my problems with my falcon appear to be caused by my (crappy) ST-ram card ;-)

Thanks!
Mark

Rodolphe, you are one crazy guy ;-) I for one would have been leery to attempt 80MHz. The CT60 is a precious rare item! Granted you could just make yourself more of them ;) Any place to get this processor easily in the USA?

Thanks,
Mark

Pin 3 & 4 together ? and no touch with the PCB ?

Also note, none of my problems with my falcon
> appear to be caused by my (crappy) ST-ram card ;-)

What was the first board ?
the only two that may crash at 20 MHz are :
- atari 14 MB
- falcon wings with 4 SIMM.

6880. EasyMint and LNX partitions

Newsgroup: comp.sys.atari.st
Date: 2003-10-01 17:59:41 UTC
From: Yves <noemail@nointernet.com>
Message-ID: <blf4opqgh1@news-reader4.wanadoo.fr>
Source record: 23260

Hello there!

I'm trying to install Easymint on a good old Atari STE with SCSI HD
connected to ICD LINK.
I set up the HD with 3 partitions using atari-fdisk under linux:
*/dev/sda1 10MB GEM boot partition
*/dev/sda2 190MB LNX partition
*/dev/sda3 50MB BGM partition (for Easymint installer)

I use ICD drivers to make my HD recognized by the Atari, but it seems only
both GEM and BGM partitions are seen from this drivers!
So when I launch the easymint installer, i'm logically told no LNX or RAW
partition is found on my HD.
I tried using CBHD drivers instead of ICD drivers, but all I can get at boot
time is 4 bombs and of course, no desktop.

My questions are:
*is CBHD able to see LNX partitions so that i can install Easymint ?
*how can I make CBHD stop to crash at boot?
*(worst case) do I really _need_ to buy HDDRIVER if everything fails? How
can I be sure it will work on my system, since demo version doesn't have
SCSI driver target interface and allows writing only C: ?

Thanks for any help
long live Atari!

Yves.

Anyone,
If I were to have my falcon MOBO overclocked to 20 mhz or even 25 mhz. What are the advantages of this??? I know that it will raise the DSP and VIDEL speeds to 40 or 50 mhz respectively. But the system bus is raised from the STOCK 16 mhz to 20 or 25 does this raise the CD-Burning limit as well??? As everyone probably knows that CD-Burning at 4X is about the MAX on a stock Falcon. But is 8X possible with a 20 or 25 mhz system bus??? Any thoughts on this one guys!!

Thanks,

SCSI transfers won't benefit of this. You'll still be limited
to 4x (though I never got better than 550 KB/s so far). :-(
If I understood correctly, the chip used in Falcons is capable
of 4 MB/s, which would allow up to 2 MB/s (as transfer is
bidirectionnal, the rate has to be divided by 2, hasn't it?),
but due to some, hem... say... misdesigning (?) this limit is
lowered to 1.2 MB/s, which, still being bidirectionnal, only
allows 4x max transfer rates. :-(
Anyway... if someone knows how to override this limit, and use
full power SCSI... ;-)

>Thanks,
You're welcome ;-)

You need to issue a DELE command for each of the mails in the mailbox.
Looking at the results of the STAT command, you've 857 mails waiting.
That's a lot of DELE commands to enter.

Unfortunately, there isn't a command that will empty all mails from a
mailbox. You could get in touch with your ISP and ask them to delete all
mails above 140kb, if you don't normally receive mails bigger than that,
or between 140kb and 159kb if you do.

You could also try using POPwatch, if it can handle a mailbox with so
many mails. Here you get the choice between deleting the entire contents
of the mailbox (CTRL-A followed by DEL) or manually delete mails within
that size range.

If you got for just deleting mails that are about the right size, there
may be a problem with time-outs due to the sheer number of mails. To get
round this, delete them in batches. Use POPwatch to log in and fetch the
list of mails, sizes etc. Then scroll through the list selecting and
deleting any that are within the 140-159Kb size-range. You'll probably
want to repeatedly connect, select, delete, and disconnect a few times
to avoid a time-out.

Finally, once you've deleted all the virus mails, you can use POPwatch
to fetch the mail for Newsie, deleting any new virus mails before
download the wanted mails.

Regards,
David Bolt

Or use the new French MEG.APP that has kept my mailbox usable during all
these virus "attacs". I posted three rules for this program here a couple
of days ago.

Cool. I wonder what the certificates are worth on ebay?

Atar dipped to as low as $4, would have accumulated but my remaining
cash went for aapl @ 20.50 earlier this week. Purchased on the dip.
Dan Niles upgraded aapl to $24.

Also, in fmday @ .34 for 3500k and 1k in goam.

> but what next ?

There is no command to trash all the emails. Unfortunately for you POP3
requires an explicit "DELE n" command (where 'n' is the "message number")
for each email sat there *plus* you must cause the server to enter what's
known as the "UPDATE" phase - (in other words) you must exit gracefully via
"QUIT" command. This is to prevent accidental deletions which ordinarily
would be a disaster.

You have a lot of data sat there (64356788 is the total). You need a program
to delete all 857 emails so try David's & Kenneth's suggestions. If
timeouts are a problem then try another program because they probably vary

in the ammount of stuff they automatically request. For instance, I once had an (otherwise good) PC program that explicitly issued "LIST n" (as opposed to "LIST" without 'n') for each and every email at connection and thus it couldn't cope with a huge mailbox on a crappy short timer that must have been tied to RETR (it never got through them all).

If worst case occurs and none of the programs can stay connected long enough then issue "LIST" command. It'll respond with 857 lines of info. Hopefully you can scroll back or log this output 'cos then you'll want to go through, find the biggest ones (rightmost field is size again like STAT above) and issue a "DELE" on those then "QUIT" (important to QUIT remember). Repeat until one of the programs can get connected. Give preference to deleting the lowest numbered "big" emails before higher numbered ones - it'll minimise the amount you're forced to manually delete before a program can get connected.

Just to summarise. You need to manually issue...

DELE 1

...to delete email that happens to be sat first in your mailbox. You can't write...

DELE 1 2 3 4 5 6

...or...

DELE 1-857

...but you must get a...

QUIT

...issued before it times out, modem explodes, universe blinks out of existence, or all the DELE commands that you managed to enter will be forgotten.

Also Popwatch has its problems. When I downloaded one (of the very few
SWEN virus related mails that MEG did not delete on its own) email the
speed went down from the usual 20-30 kBytes/sec to about 1500 bytes/sec.
When I checked the mail it had the text:

RAV AntiVirus has deleted this file
because it contained dangerous code!

and in the binary part every single byte was exchanged to LF+CR with a
total of 143866 lines! Not server related as a PC mail client managed to
get the mail at normal speed.

One might wonder what Gary Priest does these days? Would have been nice
if he released his sources for others to work on...

This sounds really really great! :)

I wonder if this E41J-version of the 060 is a full version (with FPU and MMU)?

Of course a CT60 bus frequency of 100MHz will be supported on the SuperVidel. :)

Regards
Henrik

Motorola pages always name CPU when EC/LC applies, and for E41J mask it is always said: 68060RC, see:
http://e-www.motorola.com/files/shared/doc/pcn/945048375992collateral.html

We are not worthy! We're not worthy! We're scum! We suck! That is absolutely mind boggling Rudolphe, I wish I had the cash to afford such a thing. All I can think is 100Mhz Atari (grin). You should be proud. What is the bench compared to stock ST and Falcon?

Mark

6900. ST-FAX on a Falcon

Newsgroup: comp.sys.atari.st
Date: 2003-10-02 12:19:03 UTC
From: swamptaxes-NOT-@atlantic.net
Message-ID: <XIUeb.2990$if4.2338394@newshog.newsread.com>
Source record: 23282

Hi All,
Anyone get ST-FAX to send on a Falcon with a V.92 USR modem?
Lights flash, ARQ/FAX light blinks but modem doesn't dial. Tried it at
different baud rates (matched them in the CPX), Class settings, modem ports
6, 7 or 8. With NVDI and without NVDI but with FPATCH2.
Same modem with Stik2/HSMODEM7 is ok.

John

I'm not an expert in these matters but I see no one else replies. :)

So, all this under a big "IIIC" (If I'm Informed Correctly) :

MiNT extended filesystems require XHDI, which is (I think) an API
extension to the harddiskdriver. I know that the ICD drivers don't have
this, I don't know about CBHD. HDDriver does for sure. And it's the best
harddisk driver anyway, so use it :)

However, I don't know if this is the cause of the fact that the driver
doesn't actually see the partitions. I would expect them to see them,
just MiNT not being able to use XFS-drivers.

Good luck :)

Maurits.

I made many tries under CBHD freeware drivers and it eventually sees my LNX
partition as a BGM partition!
D*mn! I don't know what I can do with it now!
I've just tried the demo version and I must admit that HDDriver is the only
one able to see my LNX partition!
Well, I guess I'll have to buy it then... :(

> However, I don't know if this is the cause of the fact that the driver

This is the cause, since when booting with HDDriver, Easymint detects the
LNX partition and tries installing (and then stops because of the write
protection inherent from the demo version of HDDRIVER)

> Good luck :)
>
> Maurits.
>

Thanks! I think I figured what's needed to do... Unless anyone knows
another solution with CBHD!?

Most instructions for over clocking the Falcon provide this
information, but had to add my two cents to the post:)
Increasing the clock speed for the Falcon motherboard does not change
the DSP clock. That is managed by it's own oscillator, 32mhz. This
clock is also shared by the SDMA chip. To increase the DSP clock, one
of the easiest methods is to cut a small underside trace connecting
the DSP and the 32 Mhz clock (located near the mid-right hand side)and
supply the new clock to the DSP clock-in from a pad on the top side
from where the trace was cut. That's usually documented in most
modification instructions. Point I wanted to make was the SDMA chip

MUST remain on the 32Mhz clock.

Oh well, HDDRIVER seems to be ok, but it's a commercial software, and I
believe that paying for a driver to install a free OS is quite a paradox!
My ST can't match with nowadays PCs and MACs productivity and still I have
to spend 35 EUR for just having _free_ fun with an obsolete computer?
That's why I try harder with CBHD, as it is freeware and said to support
XHDI... But I didn't find yet any info on how to configure it to make it see
LNX partitions...

Any help would be greatly appreciated!!

Pin 3 and 4 definately together. Perhaps I accidentally touched the PCB - this would definately explain working at 16MHz but not at 20MHz. At 20Mhz it would be receiving 16MHz from the wire and 20MHz from the board causing improper operation. At 16MHz it would be receiving the same 16MHz clock from the board and the wire and will not conflict. Definately on to something there! Although I checked very very very carefully. This shouldn't be possible.

My 14 meg card is an ACS or PCS card (I forget which). 4 30 pin SIMM 60ns. I also have an Atari brand 1meg board. The 1 and 4 meg boards use the same board, just different amounts of ram. Whenever anyone in the future blames my ST-ram card for a problem, I will test with 1 meg card first before reporting hence my st-ram card isn't the problem. (Though it did cause problems requiring me to have a clock buffer no matter what). I simply can't afford the 1 remaining action ram card right now. And no

centram's :-/

Any other suggestions?
Thanks for the help!

Mark

> My 14 meg card is an ACS or PCS card (I forget which). 4 30 pin SIMM
60ns. I

WILL NOT WORK AT 20 MHz !!
ALL board with 4 SIMM will not work on boosted bus because of too much
electrical loading (you get 4 x 8 chips on the add & data busses !!)

And the 1 MB board from atari ???? hum I never tried !!
So, you should doubt about it !
Please put a SERIOUS 14 MB card with ONE 60 ns SIMM-32 bit.

Often wondered myself. I *think* it was asm though someone please correct me
if I'm wrong.

Porting (command line) unix stuff is often reasonable in principle, even to
a non-mint target. The problem area is, as always, the socket code. :-(

Aha,

The problem was a mistake on my part which I am quite embarrassed about.
All is apparently well at 20MHz now. Now for 100MHz and 25MHz bus.

Thanks,
Mark

Hi John,

>unless I misunderstood (which happens to me frequently here :) it seems
>to work for Dennis and whoever else wishes to filter mail sent with OE.
>I don't think he meant that boycotting OE was a way to get it improved but
>rather a personal way to avoid crap!

You understood me correctly ;-)
I couldn't care care less if OE is improved or not. Today the MS software
filter was activated, and coincidence or not but the flood of crap filling
my mailbox has come to an end...

>The masses boycotting is highly unlikely in a group where most don't even
>know what anti-virus software is (group meaning pc users not this newsgroup

I don't expect this to happen anyway. Filtering out mails & news generated
by a Microsoft product is something not everyone can or want to do either,
if a lot of your contacts use OE, IE or Entourage then it's quite difficult
to implement... I think that it's only a matter of weeks before a new virus
will cause havoc, somewhere out there, there's a nutcase almost certainly
busy "perfecting" the swen virus. And having to add ever more rules and
exceptions to the filter everytime there's a new virus doing its thing, is
not my idea of troublefree mail.

>A friend told me: "nah, I don't need to run it, I'm ok!". Reminded me of
>some leaders evaluations after Poland fell in WWII !!!

I can understand why someone who keeps his system virus free, implement all
the security patches and sits behind a firewall doesn't see the need to
change to a different mailer/newsreader, but from where I'm sitting it's
impossible to disguingish between the "good" and the "bad" guys. All I know
for certain is that the crap in my mailbox is generated for almost 90% with
MS software, so the most obvious way to get rid of it forever is....

Cheers from Belgium
Dennis

6916. ATW800 / Perihelion / IMSB020 updates

Newsgroup: comp.sys.atari.st
Date: 2003-10-03 14:26:11 UTC
From: rmeenaks@olf.com
Message-ID: <1e2af2.0310030626.48fbcfd1@posting.google.com>
Source record: 23196

Hi,

Its been a while since I updated my website so, for all you ATW800 fans,
I added the following (thanks to a ATW800 user who sent me these HIGH
resolution scans):

The Atari Transputer Workstation Product Information
Atari Transputer Workstation Product Flyer (Atari)
Atari Transputer Workstation Product Flyer (Perihelion)
Atari Transputer Workstation Product Price List
Atari Transputer Workstation Technical Documentation
Perihelion Introduces the Enhanced Atari Transputer Workstation
Helios Technical Description and Product List

and I also added:

IMSB020 iX Graphics Card specs
Perihelion Transputer FarmCards specs

I also fixed several bad links but there still several more (things are
dropping like flies...)

Again, these are HIGH resolution scans hence each document ranges from
3Megs to a whopping 25Megs of disk space. They are all zipped JPEG
files which you can manipulate into your own format...

Cheers,

Ram

PS: More to come in the next couple of days...

PPS: Did you guys notice that Google no longer allows posting to
comp.sys.transputer? :-(

6917. 68060 to be sold

Newsgroup: comp.sys.atari.st
Date: 2003-10-03 15:23:41 UTC
From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3f7d947a$0$28882$626a54ce@news.free.fr>
Source record: 23197

I sell two 68060 (with FPU & PMMU) : ref XC68060RC50

These 2 CPU don't run at 66 MHz !
One is running fine at 64 MHz.
The other is running fine at 50 MHz, not at 64 (I didn't try between the two values).

My tests are done with heatsink (stuck with thermal stick) + fan.

So, the 2 CPU have heatsink stuck on them.

One is good for HADES 060 (run at 59 MHz), the other maybe...
Are good too for Milan 060 (run at 50 MHz).

Propose me a price...

Regards

> XHDI... But I didn't find yet any info on how to configure it to make it
> see LNX partitions...

Why paradox. After all, u need to BUY hardware to install free OS. Bios
and other esential things included. U still have option to use minixfs
partitions, but then u have to install MiNT manualy, or to use other person
hdd with easy MiNT, make minixfs, and copy EasyMiNT there or install KGMD,
in any case that requires some fiddling.

Yes it is obsolete, but its fun as well, i would (and i am!) paying for
this fun....

Well, I found many solutions to my problems.
-for CBHD to work with ext2 partitions, you MUSN'T declare them as LNX, but
RAW partitions (eew, strange)
-for using Easymint you have to use at least a 68030 (I know it hurts),
-so I'm now using CBHD for booting KEMD (KGMD English release), and it was
worth fiddling around, given that installing it wasn't the hardest part (I
mean it).

And I give these valuable pointers and at no additionnal cost. It's just for
fun, indeed, but "it's better when it's Free":)

Anyway, I have a new problem: Under KEMD, just after succesfully logging as
root or as other user, it shows a freemint welcome message, then comes back
to the login prompt. This situation occurs with my 4MB Atari STE but not
with Aranym.

Any ideas?
Thanks for any help!

Yves

Well there was advices that using RAW is even better as LNX. Im not sure how accurate is that, but definately wont hurt to use RAW instead LNX.

Could be lack of ram for shell to start. If i remeber correctly KGMD came with tcsh as default, u can try with bash, but dont know if its any less ram demanding... 2nd u could try some older kernel, maybe 1.14.x for 68000, they use less ram as newer kernels....

>> get the mail at normal speed.
>
>Could be all those linefeeds affected Popwatch though.

One of the problems that POPwatch "suffers" from is that incoming data
is buffered in memory. This buffer is emptied either when it gets full,
or if and EOL is received.

Without actually performing any testing of this theory[0], I'm going to
guess that POPwatch opens the file, jumps to the end, writes out the
buffer then closes the file. This probably accounts for the slow-down
with lots of 2-byte writes.

This is purely an untested theory. It may be close to reality, or that
far out even the Hubble telescope couldn't detect it. Anyone that feels
like checking is welcome to correct me if I'm wrong.[1]

>> One might wonder what Gary Priest does these days? Would have been nice
>> if he released his sources for others to work on...

It was.

>Porting (command line) unix stuff is often reasonable in principle, even to
>a non-mint target. The problem area is, as always, the socket code. :-(

Those using mint have mintnet and Magic users have Magicnet. The only
problems would be catering for those using Stik/Sting, or other stacks,
which may be solved by using Gluestik, or an equivalent.

[0] I don't yet have an 030 compatible debugger to check it with ATM.

[1] This is usenet and someone will be along to correct me either way.

Regards,
David Bolt

Why?

My system has been running fine at 20MHz for the last 2 days now without crashing and in an expanded videl resolution. It's always worth trying, and I'll try at 25MHz too. Since I have a JTAG cable I can try both ABE 5K and 5L. My simms are 3 chip, not 8. 8 chip simms never worked well for me in any application. Anyway, point is it works, and probably other 14 meg cards with 30 pin simms would work, but it probably highly depends on the simms. But the fact that it is working shouldn't be amazing. What's amazing that MY SOLDERING is what is working ;-)

Ah,

Well I cut and soldered to pins 4 and 5 instead of 3 and 4. I must admit,
sometimes I am a bit lesdyxic at times. I do feel like a fool though.
Such a simple job and my mistake could have fried my falcon. At least the
rest of the job was done properly!

Thanks,
Mark

Yes he make them. New version is very nice done, and pcb is small enough
to fit in parallel jack.. I have v1, so looks more like a spider :))

Someone may have already responded (I have trouble seeing all the posts),
A Megafile drive (small in bytes, big in size) plugs directly into the 1040
and I believe an ICD Link adaptor is needed for SCSI drives.

Hello everyone,

My CT60 conversion is not going well, and I don't know whether to blame the motherboard, the power supply, the RAM, or my somehow blowing up something with static.

Here's what I'm up against, with a CT60 plugged in...

1) The floppy light stays on constantly. This started about an hour before I even put in the CT60, but after I had put in the power supply. This makes me a bit suspicious of the power supply.

2) HDDriver 8.13 cannot autoboot or correctly partition my drives. It doesn't generate any error messages, but when the desktop comes up, the "C" icon does nothing (not even an error message) and installing drives "D" and "E" gives the standard 'no drive there' error. Actually, one attempt to partition using HDDriver completely corrupted both my hard drives, causing a lockup at boot or when running from floppy. I have recovered one drive with ICD utilities (the drive now works fine if I partition and boot via ICD in 16 Mhz 68030 mode) and think I know how to get the second one working, but HDDriver is becoming a very frustrating $65 purchase.

3) The CT60 mode has substantial instabilities. On rare occasions I get 2-4 bombs even before the boot sequence finishes or when I change resolution. More often, I get 5-20 minutes of use (it's a bit hard to test when you're still running off of floppy), but the darn thing isn't stable. Recently I've even had a few crashes with 16 Mhz 68030 mode.

Considering Rodolphe's attention to detail, I'd be very surprised if the problem were the CT60 board itself. But where should I look to solve these problems?

Galen

Galen,
Are you sure that everything is installed
correctly??? Double check all hardware connections
and installation procedure. Apparently the TRACE is
cut or you probably would not even be able to bootup.
Are you using SCSI hard drives to try and bootup your
system??? If so, I have had serious problems with
SCSI stuff trying to copy files to that hard drive!!!
Try and find a very fast IDE notebook hard drive or
buy and adapter to switch it from notebook hard drive
connector to regular desktop hard drives. Performance
gain using IDE is very impressive!!! It is about
double in MB/sec versus SCSI. Have you sorted your
auto folder??? XBOOT also gives serious problems and
will cause illegal format errors while booting into
CT60 mode. I had SERIOUS system crashes after only 5
to 20 minutes of use also with the CT60. I was
getting SPURIOUS INTERRUPTS left and right. The 2
things I did were sorted the AUTO FOLDER and changed
the OSCILLATOR from 66.666 mhz to 72 mhz. and all is
WELL!!!!! Matter of fact I have been running my
FALCON 060 for 17 to 18 hours today alone straight
without ANY rebooting!!!! The only other thing I can
suggest would be your power supply or RAM is your
SDRAM CL=2 and/or PC133??? PC100 seems to give more
problems because PC100 most of the time is CL=3 and
this gives instability problems on the CT60. Let us
know if you get anywhere with it. Happy to help if
you need it.

Thanks,
Carey Christenson

This is a bit odd. Did u try inserting fastboot floppy or similar, esp if u dont have IDE drives. Only reason i had with constant led, was when i connected floppy drive data cable other way arround... Just curious, how did u use power supply without CT60? And i hope u connected floppy power cable properly on CT60!

U should try removing CT60, put back that jumper and try f030 only. If probs will remain, u may have problems with motherboard.

It's an IDE drive ?
Do you have XBOOT ? With the cache a config saved seems create
problems.

> 3) The CT60 mode has substantial instabilities. On rare occasions I

It's possible than the SDRAM causes this problem or maybe your 060 not
support the overcloking.
About the SDRAM you can try with the 2 shifts pressed during the picture
and until the logo to boot without SDRAM and compare the results.
Do you have the boot 0,99d ? If the SDRAM CAS latency isn't supported
you can see a warning.

> Considering Rodolphe's attention to detail, I'd be very surprised if

Thank you, and all the others who helped me. It's rather inconvenient that
there is no such command, but life is like that, obviously.

>You could get in touch with your ISP and ask them to delete all
>mails above 140kb, if you don't normally receive mails bigger than that,
>or between 140kb and 159kb if you do.

I got in contact with their technical support, and they were not willing
to do that, and neither could they provide a filter to automatically
kill all infected mail before reaching my mailbox on the POP server.
On the other hand, they have a good virus scanner, so -ALL- the
infected emails in fact get packaged by their "gatekeeper" as attachments
to a short notification email with the subject conveniently set to
"VIRUS DETECTED IN E-MAIL TO YOU" (if they do that, funny that they wouldn't
want to filter it out themselves...)

>You could also try using POPwatch, if it can handle a mailbox with so
>many mails. Here you get the choice between deleting the entire contents

>that size range.

>Or use the new French MEG.APP that has kept my mailbox usable during all
>these virus "attacs". I posted three rules for this program here a couple
>of days ago.

I downloaded and tried these two programs, and they are both perfectly capable
to purge nasty messages. Luckily, here the detection rule can be very simple
(as seen above)...

However...

Both of the programs, of course, first download and display the message headers which takes a rather long time for 850+ messages, and I pay for my internet by the hour (and it is not very cheap).
So, finally I solved the problem by telnetting to the server, issuing the LIST command to see that -all- the messages in that monstrous heap were of the right size, and then issued DELE nnn commands. Yes, about 857 times, in several batches of about 100 :) A couple of simple computations beforehand showed that it would only be equivalent to typing about one or two pages of text- and I can type pretty fast. Some timing showed that the messages were deleted this way in only about -one third- of the time it would take Newsie or Popwatch or Meg to do that. Fortunately, I had no problems with timeouts.

In any case it seems that this flood is slowly receding. With a smaller number of infected e-mail messages, I can now put Popwatch to the task of killing them automatically. I have no great wish to repeat what I have done.

Thank you all, guys;

cu

There are also other host adapters available, like the Link 97
plus another one, both from Germany - useful since ICD no longer
produce them. You may be able to get used ones from the few
remaining Atari dealers. I wouldn't recommend the Megafile unless
you are happy with only 20 or 40 MB (or so). At one time Atari
users thought this ample, and it costs hundreds of dollars/pounds.
Now you can get several Gigabytes for a fraction of the price - in
SCSI and IDE versions. IDE on a 1040STe needs a special internal
adaptor - the host adaptors are external. Note that the links must
be provided with termpower (a 5V supply) to feed its electronics.
Most (but not all) hard drives can be set to provide them -
otherwise it can be done with a simple diode connection to pin 22
of the SCSI socket from the +5V supply to the drive.

The only problem I've found with ST-Fax is that the scheduler button seems to be set as a default (Falcon CT2, MagiC 6.20. NVDI 5) and must be cleared before a fax can be sent.

Source record: 23230

Hi there,

I'm running Aranym 0.8.0-pre3 on my Linux machine. I am trying to enable Aranym to read files to/from my Linux filesystems, but Betados reports 'c:\auto\aranymfs.dos, BAD file error.' when I boot the emulator. I have a TOS 4.04 ROM image, and a disk image of my Falcon030 1.2GB IDE disk...

Does anyone have an idea how I can fix this? I'm not sure what causes it and I'm just following instructions provided with the emulator...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

A free OS? Technically speaking, TOS is even more expensive. But you
just got it cheaply with your ST. ;) Still, just look at the total costs
of getting a fully running MiNTos station, and compare that to a PC or
Mac. It's still a cheap toy, as long as you look at the big picture.

> My ST can't match with nowadays PCs and MACs productivity

In that case, don't use it. Mine certainly can though, depending on what
it's used for.

> That's why I try harder with CBHD, as it is freeware and said to support
> XHDI...

Is it? Oh in that case something else is wrong.

> But I didn't find yet any info on how to configure it to make it see
> LNX partitions...

It shouldn't need any configuration for that.. unless perhaps XHDI can
be switched off.

Maurits.

Hi!

I'm not sure where you got the c:\auto\aranymfs.dos filename, but we are using the hostfs.dos at this time for about a year already. There is probably no aranyfs.dos file any more. Please, download the afros disk image and try that. It has all the necesssary driver binaries. Please use the hostfs.dos one.

regards

STan

>
> Galen

Well.... the situation is like this. I fired up the STe after about hmph!
years, and everything still worked. But, as I recall, I deleted the
partitions to create some other ones. Like, a partition for use with
medium/low res games, and one for hires stuff. I think I also deleted the
logial unit. I more or less recall having seen a warning message about low
level formatting / not being able to format the disk. At that time I could
not locate all the drivers disks in the rubble in my attic, so I abandoned
it for a while. Please understand, I had been using DOS machines for quite

some time, and more or less followed the rules that apply to these.

Two weeks ago or so, after another few years stop, I tried to get the machine working again. Came across the harddisk (no partition, no logical unit available), but this time I have all my Atari disks on my desk. I follow tha manuals instructions for a hard disk format..

I fire up the machine, and the hard disk light comes up. It rattles and hums, while the memory test is performed. However, after booting (with or without AHDI.prg in the auto folder on a boot floppy) I run HDX.prg fom the Atari Advanced Hard Disk Utilities diskette. The program starts, and then I select either Disk/Partition or Disk/Format, and immediately the hard disk light burns. It lasts for about 15 seconds, with a blip every three seconds.

Then, with Disk/Partition selected, I get a message that partitioning will destroy all data. But, there are no logical units available for partitioning. All grayed out.

So, I select Disk/Format. Another warning, and I can select only Logical Unit 0 (other units grayed out). I select, and get a warning: " the logical unit you selected does not exist. Click OK to re-select".

The hard disk does spin. It does not stick. I tried another scsi disk from an old Unix box from the office, that one was stuck. After some careful twisting, it runs again. Same procedure... same result. Later, that office disk would boot the system in the office.

I think that I need a low-level formatter, or such a thing. I may have done something a few years ago that I should not have done (obviously), but the entire system (STe, monitor, second floppy) works perfectly well. Even all the floppies I have tried so far do not show a glitch. Only thing... I cannot format the hard disk.

I really would like to get this old dear thing completely working again. So if anyone can help me out.... please do so. I scanned through all my floppies, but cannot find something to help me out.

Thymen

6952. Eiffel ready to ship

Newsgroup: comp.sys.atari.st

Hi,

I have a very small batch of Eiffel ready to ship, I have contacted
the first few who originally got in contact with me about a month ago.

I have updated my http://hardware.atari.org and will soon be putting
up a zip file containing source code, readmes, schematics etc.

Anyone interested, please contact email me with the folowing email
address - hardware@atari.org

Thanks, Lyndon

6953. Gribnif and Dan Wilga are still around....

Hello all,

After I wrote my STe article for MyAtari, I decided it was time to have my STe multi-task. So I installed Geneva and ordered a copy of NeoDesk 4 from Gribnif. I was not sure if they were still around, but sure enough that are as well as Dan Wilga. He was very helpful and sent me my copy pronto. Works just great too.. In case no one realizes, I have Geneva installed on my Hades and it works great along with the EASE desktop. For some reason though, EASE does not like my STe when ran with Geneva, so I ordered Neodesk. It is nice to see some Atari software companies still around these days...

I tried that one now, but both give me the same "BAD file error."
when Betados boots.

I launch aranym with 'aranym -dm:/home/chrisw/ATARI/'
In '$HOME/.aranym/config' file there is [HOSTFS] section
which I also edit to show M: as mapped to /home/chrisw/ATARI/
Is that the correct way to do this?

Source record: 23238

Chris..

The -d command line option is an alternative to the .aranym/config line.
You don't need to use both of them.

Put the following line tnto the bdconfig.sys
*DOS, c:\auto\hostfs.dos, M:M

It should be all and working when you enable the BetaDOS.PRG in your C:\AUTO

In case of further problems send the bdconfig.sys snippet and the
C:\AUTO folder listing to the aranym-user mailing list. There we can
help you more while not bothering others here.

best regards

STan

Hi Djorde,

>However...
>
>Both of the programs, of course, first download and display the message
>headers which takes a rather long time for 850+ messages, and I pay for
>my internet by the hour (and it is not very cheap).

Well, in this particular case Iconnect seems to be the obvious solution, it doesn't load the headers, but initially only displays the number of messages present in the mailbox and their respective size, it's up to the the user to decide wether to download, delete or view the message header(s). So instead of downloading and displaying all the message headers you can simply issue a delete command for all mails with a size between 145kb and 155kb. Using this method of course you run the risk of deleting genuine mail also.

>So, finally I solved the problem by telnetting to the server, issuing
>the LIST command to see that -all- the messages in that monstrous heap
>were of the right size, and then issued DELE nnn commands. Yes, about
>857 times, in several batches of about 100 :) A couple of simple
>computations beforehand showed that it would only be equivalent to
>typing about one or two pages of text- and I can type pretty fast.

A mouse click substitutes the DELE command in Iconnect, 857 mouse clicks is quite a lot, but it beats typing two pages of text, well, actually the DELE command is flagged automatically, it's the GET command which needs to be disabled 857 times.

>Some timing showed that the messages were deleted this way in only
>about -one third- of the time it would take Newsie or Popwatch or Meg
>to do that. Fortunately, I had no problems with timeouts.

With Iconnect you can increase/decrease the time out settings of the server.

>I have no great wish to repeat what I have done.

I'm rather pessimistic, it's probably just a matter of time before we are hit by the next wave. This must be like a wet dream for the morons that create viri/worms, they not only managed to disturb just PC users but all internet users, no matter what platform they use...

Cheers from Belgium
Dennis

This is not good news... Trust me :-/ This will set a precedent other software developers don't want to see. On the bright side it might cause people to consider programming with things like Delphi or another language instead of that vulnerabilitymaker we call C.

Hi all !

New version of MyMail (1.62) released.

I have cause of the large amount of spam put down a big
work on the spam filter this time and added a function
for automatic sending of spam reports.

The plan was to include more in this release
but my free time for coding mymail is limited
so I decided to do the release now to help
all of you having problems with spam-mail.

Major improvements & bugfixes:

- Spam filter bugfixed and now includes
a auto-reporting system.
- Editor now works on texts up to 64K
- Queue sending with dialer/modem was not working. Fixed now.
(read more in the history.txt file)

Download from:
---
http://erikhall.atari.org/programs/mymail.html

Hi Rodolphe,

You must be very proud of your work on the CT60. I am very pleased
for you and all those lucky Falcon owners who had the good sense to
buy one.

I think it is good news for everyone (Hades and Milan owners included)
especially now that all those dedicated developers have a 68060 in their
machines. It's nice having a little bit of extra speed isn't it ;-)

Regards,

Peter

Almost close, a single user is filing this suit and the anti-ms crusade are trying to get it switched to a class action suit, its highly likely to fail on the basis that if it wasn't for a criminal element targeting MS product then there wouldn't be an issue.

Think about it, we all sure lock manufactures coz we get burgled!, doh!!

```
Not only the EDO ; the bus is half speed in hades and milan (30 & 25 MHz).
CT60 uses a Full speed bus = 66 or 100 MHz.

Difference is enormous...

so you're saying that if most households are using faulty locks then
lets put the blame on the criminals for us needing locks in the first
place! No criminals = no issue???

What I think Steve is saying is that if someone finds a way to pick the lock then the locksmith can't really be held responsible. And lets face it, thieves have been picking locks for years and the design hasn't really changed.

As much as I have no love for MS I can't see this one getting through.

BTW, its great to be back on the forum, and great to see some familiar names still posting.

Is there a App -> mint/unix -> STiK library per chance? I'm a bit rusty on
these things. Not asking for all singing and dancing thing, just basic
bring a socket up, connect to port type thing.

The real angle to try is the marketing of a faulty product. The overall security issue shouldn't (in my opinion) be the focus of the lawsuit. As others have said, in regards to the lock and the lockpick, thats a no-winner. but to sue them on the grounds that they knew they were releasing a faulty product for sale....and with the amount of patches they have released for XP, they had to have known.

Tony

of course all locks are vulnerable including removing the lock
entirely from a steering wheel but my point is whether the lock is the
best it could be (even if the best lock would only slow down a burgler).
The problem I see is that the end user is having to "slow" him down.
Sure, even banks are robbed but at least they try to thwart the burgler.
I don't see that happening with Microlimp's software!! The way it looks
is that there are NO locks at all on programs such as OE. Patch all you
want but it's like painting over a rusty surface!
Anytime a company gets too big they are arrogant due to little or no
competition and have no interest in doing their best except at making
bucks and the end user has to pick up their slack at his cost (whether
it's in time or money)!

can't the security issue be the result of a faulty product? Seems to go
hand in hand!

The jumpers mey be inside, and you may need soldering iron to resolder them
(as I had to do).

6981. 3.5" DSDD ("720K") diskettes

Newsgroup: comp.sys.atari.st
Date: 2003-10-08 13:38:07 UTC
From: "Glen G." <novirusforme@nowhere.com>
Message-ID: <t6ednYroD-LEjhmiU-KYiQ@gbronline.com>
Source record: 23063

Hi --

I have a number of old computers which require 3.5" DSDD diskettes and recently had an opportunity to purchase some of them (more than I will ever use, but I had to purchase the entire lot). A friend suggested that I post to a few Usenet groups pertaining to machines which have the same requirements -- somebody else probably could use some of these, too.

Here are the details:

Retail 10-diskette boxes, Certron brand, shrinkwrapped, inner plastic sleeve, labels included. Look and act just like brand new. I opened a couple of boxes and formatted half a dozen diskettes without incident.

They're packed in a couple of different-sized cartons: 10-box and 42-box. Cost: $1 per 10-diskette box, minimum 10-box order (one 10-box carton). USPS Media Mail is the best bet for shipping: $3.52 (for a total of $13.52) for a 10-box carton (100 diskettes), and $8.74 (for a total of $50.74) for a 42-boxer (420 diskettes).

If you prefer, I can ship via UPS, but it costs a few dollars more.

I'll ship them from my company address, so I can accept PayPal, VISA, MasterCard, American Express, or Discover. If you have another payment option in mind, please let me know.

If you want in on this deal, please send a note to glenatacme@aol.com. I'll reply privately and if you're in the USA I'll include my toll-free number so you can call and we can discuss the details.

BTW I'll be happy to ship internationally.

Any questions drop me a note at the address mentioned above.

6982. FA: King's Quest 2 and Police Quest 2 (from Sierra - boxed/complete)

Newsgroup: comp.sys.atari.st
Date: 2003-10-08 18:11:14 UTC
From: "Paul N." <visit_my_site@nurmix.com>
Message-ID: <mgk8ovcaae8am738kfl2bfu2hmt1sd5vkl@4ax.com>
Source record: 23064

I have the following two Sierra games on auction at ebay (no reserve):

"King's Quest 2 - Romance Of The Throne"
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3051948433&category=21179&rd=1

"Police Quest 2 - The Vengeance"
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3051952004&category=21179&rd=1

Both games are boxed and complete, in beautiful, almost new condition
(I bought them new many years ago, but never used them).

I'll be putting up a few more Sierra games in the coming days as well,
if anyone is interested.

Thanks!

similar here even though I never give my freeserve address(so where do they get it?) there is a few hundred a day, as None of them nean anything I have asked Freeserve if they could send me a letter if there are any important changes and just ignore the freeserve mailbox, I suppose it will eventually become full and bounce all back

6986. HD Driver and ASCI bus

Newsgroup: comp.sys.atari.st
Date: 2003-10-08 22:45:24 UTC
From: leaver@alphalink.com.au
Message-ID: <3f849384@news.alphalink.com.au>
Source record: 23068

I have a TT running MagiC 6.20 with HD Driver 8.03.

A couple of months ago I converted a 3.2gb Quantum Fireball drive on the SCSI bus to FAT32 partitions. The internal drive and a Syquest EZ230 still use BGM partitions. Everything on the SCSI bus seems to work normally, except that MagXDesk takes a few seconds to assemble a FAT32 partition for display on the first time I open it in a session.

On the ASCI bus I have a SupraDrive FD10 which I seldom use, so it was only a day or two ago that I noticed the following behaviour. The FD10 uses an Hitachi drive and has its own, venerable SCSI adapter.

At any time during a read or write to the FD10, disk operations can freeze. The TT has not crashed. Any program already running is accessible, but no disk operation is possible. The freeze will last a predictable amount on time, a few seconds less than two minutes, after which the read or write resumes as if nothing had happened. Nothing appears to be wrong with the completed read or write.

In a test copy of a folder containing 25 files files I experienced four of these freezes. Initiation of a freeze seems to be random, but the duration is constant, as if some long value is counting down from -1 to zero. Freezes can occur during a desk-top copy or during a read or write by an application.

I have background DMA enabled, but switching it off makes no difference.

If a freeze occurs during a copy by MagXDesk and I bring up the MagiC task list (Alt-Cont-Esc) something appears strange. The byte-count for MGCopy looks like a random number and the entry for MGcopy is followed by a second line with no task-name but the same byte-count. I have no idea if this is related or means anything.

Does anybody know anything about this?

I have, though there really isn't much to check with the 16Mhz option.

> Are you using SCSI hard drives to try and bootup your

Hmm? I will try an IDE drive. What is the cable length limit?

>Have you sorted your auto folder??? XBOOT also gives
> serious problems and will cause illegal format errors
> while booting into CT60 mode.
That's good to know. I'm using a floppy with just HD Driver on it
right now.

I am having the same types of problems -- I wonder...where did you get
your oscillator?

> The only other thing I can suggest would be your
> power supply or RAM is your SDRAM CL=2 and/or PC133???
It's a 256 MB PC133 DIMM. I can't remember right now where you check
for CL=2 or CL=3 -- it's at the startup screen, isn't it?

I am actually using a two floppy adapter minicable since I couldn't
find a floppy extension cable. It seemed to work, at least at first.
I used the power supply by shorting the +5V pin that is always on,
even when the system is off. The power supply has an on/off switch.
As for the floppy power cable, I did triple check it, so that's OK.

Dan is around, but he hasn't really done anything since 1999. Still,
I use
Geneva and NeoDesk on my Falcon (and previously on my STe) and I'm
impressed with how well it works. If you have 4Mb or less of memory,
it's a very good choice for an OS.

Galen,
I currently have about a 2 foot cable on my IDE
chain for 2 IDE hard drives listed at the bottom of
this page in my SIG. Obviously, the shorter the
better. It could be possible that booting anything
from the floppy with the CT60 may give problems
especially if you do not have the latest updates.
What updates are you using??? I am using ABE5K and
SDR5D just for future reference for you. The 72 mhz.
oscillator came with my CT60!!! Did you not get one
as well??? It is my understanding that if there was a
problem with the DIMM that the CT60 would not even
boot properly. Not sure about this because I have not
experienced this problem. I recieved an e-mail from
Rodolphe a few days ago saying that if your DIMM is a
PC133 but a CL=3 that it is most likely to not give
any problems. Mine just so happens to be a KINGSTON
512 meg SDRam PC133 part # KVR133X64C3/512 where the
C3 indicates that it is a CL=3 but on my system it has
always booted up and given NO problems. Anyone else
out there also using PC133 but a CL=3 latency and not
having any problems??? If so, what kinda problems???
But to answer your question I believe that Rodolphe
had something put into the bootup that if there was
problems with the DIMM that it would let you know. If
there is anything else I can do for you let me know.

thanks,
Carey Christenson

Did you switch the Fast ACSI option on? This does not work with some
drives (also refer to the manual) and may result in the problems you
have observed. Try to switch it off.
Besides note that the ACSI bus of many TTs is not working properly. But
with these TTs you usually get a loss of data with fast drives connected
to the ACSI bus. In your case it seems to be something different.

LP's hades.hyp was informative (thanks lp) but I still couldn't find
a set of pads marked 0,1 or dso,ds1. Tracing from the cable pins (counting
from either side) looks either like 10 and 12 aren't connected to
anything or they go directly to a chip! I'll look around for one of the
drives listed as "known to work". Note that this drive is an Epson SMD-300.

This message is for Lyndon Amsdon.

Hi, Lyndon. You have problems vith your mail?

You have received the transfer?

The passed Monday 6 October 2003, I carried out a transfer of £100 + £14.13
of banking expenses. Total £114.13 pounds sterling (163,83 € euro). The
transfer shipment operation has been correct. Ok.

I am expecting the confirmation of the reception of the transfer.

If there is some problem, you communicate it to me.

Regards

Pablo

Exactly, locks were invented to keep out thieves.

Where i used to live we didn't have locks, they weren't needed and there
were no break-ins, not because of the lack of locks but due to the lack of
thieves.

So if i drain the oil out of your car and the engine seizes, you'll sue the
car manufacturer for fitting a faulty drain plug on the basis that it was
the device i utilised to gain access to your oil?

Weet iemand misschien nog een programma te achterhalen waarin het MIDI
geluid op de ATARI valt te bewerken ?
Ik weet dat diverse bands er mee werkten, maar weet niet meer hoe het
programma heet. Hoe kom ik er aan ?
Mail maar aan rtenhoor@tiscali.nl

Uwe, thanks for the response. I should have mentioned that I have Fast ASCI switched off, but having it switched on makes no difference. (The FD-10 could not be considered fast - it uses a 10 mb 5.25" floppy medium.)

I had never experienced this behaviour before creating the FAT32 partitions on the Quantum. However, since I posted my message, I have tried booting with the Quantum switched off, and with the "#_DPP -f2 -F32 -S2 J:" line deleted from MAGX.INF, and the FD-10 still freezes in the same way. There may be no connection with The Quantum.

Ok, Lyndon.
Thanks by your messages in which you confirm me that you have received my transfer.
I am anxious by installing the interface Ehernet for my Atari STE, your called EtherNEC.
I believe that thanks to your magnificent work my Atari is going to acquire a marvelous value added. Perhaps me do not mistake upon saying that your interface is one of the better peripherals than in these last years have been able to develop for ours dear Ataris. It is the integration of the Atari ST in the network, living together with other machines that today are also more powerful -in many cases-, but before the ones that the Atari ST shows that still it can be useful and that can understand its language.
I'm seeing pages and messages in the web that do reference to your EtherNEC, and all expose positive comments. It would desire that your work had the maximum diffusion.
I expect that you, and other persons with your knowledge, talent and interest, you can continue investigating in new developments for these machines that the atarianos do not want to abandon.
Thanks, I expect the reception of the package and good luck.

Hmmm. I don't think so. It is possible that I overlooked it in the
box and threw it away, but all I remember are a few minor parts like
surface mount resistors.

> It is my understanding that if there was a

>thieves.
>

how about this: the problem (as I see it :) is that there ARE thieves in
our net neighborhood and microlimp refuses to acknowledge the possibilty
that their software provides no protection against them. Hence the need to
use our own locks (running anti-virus software and using filters, etc)!
You can't believe that OE, etc., is the best that it could be as far as
providing protection against net thieves! Even if it wasn't intended to do
that, since it is known that OE doesn't survive break-ins shouldn't
that company (at least morally) look the possibility that OE is faulty in
that area?
A lawsuit doesn't necessarilly have to be won to to get microlimp
to take a harder look at the issue! In US politics, just the threat of
legislation being entered can cause changes!
Regarding your oil plug analogy, if the company leads you to believe
that you will be relatively safe from oil draining thieves by making sure
the plug is there before a thief opens it then the company is at fault.
What if banks had the philosophy of "protect yourself after a neighboring
bank was robbed"? Put your money in a mattress?

> > have my STe multi-task. So I installed Geneva.
I'm glad to hear that you are still active in the Atari market.
With the Geneva demo I found out:
- to use a file selector from choice, like my BoxKite, would be better
- the Gemini desktop didn't work thus I would appreciate some more
options to optimize compatibility
and thus would be pleased if you continue working on Geneva. Because it
prospects a single tasking mode for "critical" programs it appears to me
a much better alternative to N.AES or XaAES.

regards, Ludwig

Hallo Richard,

comp.sys.atari.st is een Engelstalige nieuwsgroep, dus ik ga nu verder in
het Engels:

It sounds like you're new in the Atari/Midi world.
Some things you have to know:

1. Basically MIDI is NOT sound, only notenumbers and controllerdata and
things like that. The sound is made by the attached internal or external
synthesizer/sampler/soundcard. There is a lot of info about MIDI basics on
the net.

2. Once you have understood point 1 ; Yes, there is a lot of Atari
MIDI software around. If you want to work with sequencers and synth
editors the Atari is still a great machine.

3. Take a look at Tim Conrardy's excellent website
http://tamw.atari-users.net to get started. Here you will also find a link
to the atari-midi mailinglist. Join that list, and almost all your answers
will be answered by experienced Mid/Atari users.

3. The name of your computer is 1040 ST not 1024 ST

4. You say "several bands worked with it". In fact several bands /
producers / songwriters are still working with it today !

7015. C-LAB Falcon MKX/EtherNEC woes

Newsgroup: comp.sys.atari.st
Date: 2003-10-10 13:55:49 UTC
From: julianwolfe@earthlink.net
Message-ID: <de454671.0310100555.7a4a9c76@posting.google.com>
Source record: 23147

Greetings, The Scene!

Hoping someone can help me out here...I've recently purchased a C-Lab Falcon MKX to replace my Mega/STE as my main machine. I just moved all my software over, and am starting on the STinG/EtherNEC installation. After installing the EtherNEC, I've found that even though I can see the MAC address through STinG, the card will not communicate with anything...Doing a PING yields no yellow lights. I purchased the EtherNEC fully asembled with card from Lyndon Amsdon.

Here's my STinG setup:

Path - C:\STING

ENEC3.STX
RESOLVE.STX
TCP.STX
UDP.STX

ROUTE.TAB:
192.168.254.8 0.0.0.0 EtherNet 0.0.0.0
0.0.0.0 0.0.0.0 EtherNet 192.168.254.254

Mind you, save for ENEC3.STX in place of ENEC.STX, this setup is identical to that on my Mega/STE, which works 100%

I tested this under MagiC 6.20 and plain TOS 4.0, and neither makes any difference.

The setup on my C-Lab Falcon MKX:
MagiC 6.20, NVDI 5.03, 14MB RAM, ScreenBlaster II

The setup on my Mega/STE:
MagiC 6.20, NVDI 5.03, 4MB RAM

This problem seems uncannily similar to the EtherNEC problems TT owners seem to be discussing here on C.S.A.S.

Note: This is one EtherNEC that I've been moving from machine to machine, so I know it works.

Julian,

Bear in mind I have never been able to get Ethernec working under STiNG
using Thomas Redelberger's drivers. My solution was to use ozk's mintnet
drivers at http://assemsoft.atari.org in combination with either MiNTNet
under MiNT or Magxnet under MagiC. This of course poses a problem if
you're a singletos/geneva/other system kind of guy. However from your
post it would appear you are a MagiC guy. Magxnet is highly recommended
by me, better internal latency, better throughput, even through the
gluestik arbitration layer. It just doesn't have the pretty config utils.
But I only had to place a few files in the right places and setup I think
3 lines of one file and 1 of another. Not complicated.

Alas, perhaps *someone* will be able to assist you with the STiNG setup.
I dropped that stack ;-) Of course the STiNG drivers might work better on
a non-falcon machine, but that wasn't a consideration of mine - I have a
falcon. Incredibly even after getting a CT60 everything still worked with
minimal changes - a credit to ozk and Lyndon's design. However if you get
a CT60 I would recommend an older version of ozk's driver which I can send.

Source record: 23151

Hello guys,

Well it's apparent now that my ST-ram card is the culprit in my system instability on my tests at 20MHz bus. As such I am looking to trade a non-CT60 owner (and never will be a CT60 owner) memory cards. I'm looking for a CT60 compatible card including the Action RAM card or the CentRAM. Also if anyone has a spare 4 meg Atari board laying around that might help my situation too. I have a 4 30 pin SIMMS memory card that works fine with the CT60 itself, just not under bus acceleration. It even works okay under bus acceleration but will eventually crash. I'm looking to have a 25MHz bus and a 100MHz machine. It's fast enough.. I just want faster ;-)

Thanks,
Mark

Geneva is really a solid piece of work. More program work under it
then under Mint or Magic. It runs like a charm on my Hades and my
STe.

Hrmm..

I ported Id3ren or something like that a while ago. It's a cool batch
renamer proggie and can do a lot of cool stuff. I'll pack it up in an lzh
and test it outside of mint.

Thanks,
Mark

Alexander,

No problems, just 0.0.14 or 0.1.14 or something .14, whatever I have is
faster for evl and I. With the latest driver I pull maybe 350K/sec, with
the 0.14 I pull 420+K/sec.

Thanks
Mark

Unfortunately the ASCI input cable is a fixture in the drive, but it's
only about 50cm - it could not be much shorter.

Ummm WHAT??? No, the plug wasn't faulty. The plug worked just fine. If
the auto company sold the car with an oil plug that they knew was bad, and
no matter how many times they reengineered the plug it STILL didn't work,
and then they sold the car with the faulty plug anyway...that was my point.
Thats a better example.

to rebut myself;

Ford had the Pinto with a bolt that punctured the gas tank on a rear end collision that caused an explosion. Even though they lost the lawsuit, they decided to not recall the faulty cars because it was cheaper to pay the death claims rather than replace each bolt. So, even though a product from a big company can be deemed as faulty (whether OE is or not), it doesn't mean any action will be taken to fix the problem (if it can be fixed) /:)

Bonjour :)

A bugfixed version of Meg 1.2 (mail checker and antispam filter)
is released on my homepage.

- bugfix of filter 'case sensitive' string search in Body
- bugfix of freeze if authentification has failed
- work-around for $HOME on MiNT ext2 partition (save the MEG.INF
beside the program if it cannot write in $HOME folder)

Direct download at : http://rajah.atari.org/files/ -> meg12b_uk.zip
(~220Kb)

Voila :)

Does anyone have experience with working on a Falcon with the programme NEON? I am thinking about using it on my Falcon but first one to know what has to be done before doing that. I know that you need a FPU. Is that still true or are there any nonFPU versions of NEON? And i've read something about that it is better not to have a coporocessor in the Falcon. Or am i mixing things up now and is it that you better not have a FPU installed and do require the coprocessor...

And if in the case that i need a FPU; where can i obtain one from?

Thanks in advance.

Neon is actualy very nice and capable program. Easy to learn, with
powerfull and advanced options which makes life easier. Also include some
tricks to speed up work, like main croshair usage, black option (switch
video off when rendering, so up to 20-25% increase of rendering speed)
etc...

Hi "The6502Man"

The plug worked just fine, it held in the oil, until someone stole the plug,
would you blame that on a design fault or a plug thief, is it the makers
fault they stole the plug? or thieves for stealing it.

> are there any nonFPU versions of NEON? And i've

Not hear about that.

> read something about that it is better not to
> have a coporocessor in the Falcon. Or am i

Itï¿½s not a mistake but itï¿½s only a feature.
Not realy needed for other software like games, word process and some
else.

> And if in the case that i need a FPU; where can
> i obtain one from?

Iy you had an stock falcon a cheap 68882/16 is enough.
For an acelerated falcon you need a expensive 68882/32/..50
Try to ask you local computer chip distributor.

Hi John,

>What if banks had the philosophy of "protect yourself after a neighboring
>bank was robbed"? Put your money in a mattress?

They won't...
Banks pay a hefty insurance premium against this sort of hazard. Robbery, fraud, earthquake... whatever. In theory a bank should be robbed at least once every five years to make the initial inventment of the premium more or less worthwile :-)

Cheers from Belgium
Dennis

Just note: later versions of Neon dont require a dongle. I bought mine at Neuss show, and only got manuals with it, no dongle. There was TT version (u had to specify what computer u have) which i think still asks for dongle.

I see we can do this forever :)

It depends on what you think the problem is (which depends on the angle
you view the situation from)!
From Ford Motor Company's point of view, there never was a problem
so why find a cause to a non-problem? ("if it ain't broke, don't fix it").
Same with the US government and Agent Orange (among others). Different view
from families that lost people!

Cause and effect ---
Initial cause of accident: pick a reason.
Cause of gas tank explosion: effect of a poorly situated over-sized bolt
(placed there by Ford) that penetrates the gas tank on rear impact!
Initial cause of virus: pick a sicko!
Cause of viruses spreading: a petri dish environment caused by the
effect of poorly developed programs (placed there by mocrolimp) that do
nothing to prevent infections by a sicko!
Hey, who the heck am I to really know. I'm not a programmer but it sure
does look suspicious to me and it needs to be looked at a lot closer by
Ford, uh....Firestone, uh....micro....!

>
>Path - C:\STING
>
>ENEC3.STX
>RESOLVE.STX
>TCP.STX
>UDP.STX

You might want to try ENEC.STX to check if it works better than ENEC3.STX
Also the physical order of .STX files in the STING folder is of some
importance. On my system (TT with Magic)) ENEC.STX has to be the last
.STX module.

>ROUTE.TAB:
>192.168.254.8 0.0.0.0 EtherNet 0.0.0.0

What is this? If you simply have another computers etc on the same
(Ethernet) network there is no need for extra lines in the routing table.

>0.0.0.0 0.0.0.0 EtherNet 192.168.254.254

If the default gateway (router) on your network really has the IP
192.168.254.254 this is the only line you need.

>Mind you, save for ENEC3.STX in place of ENEC.STX, this setup is
>identical to that on my Mega/STE, which works 100%

Except for the running order of .STX modules perhaps... Make it 100%
identical and go from there testing if ENEC3.STX works.

>This problem seems uncannily similar to the EtherNEC problems TT
>owners seem to be discussing here on C.S.A.S.

Maybe, but I have not heard of any Falcon users unable to get EtherNEC
running with STinG.

> >
> >One is a cause, the other is an effect!!

> I see we can do this forever :)

But since no one has p'd in the pool yet its still nice and cool.

I acknowledge that there is the potential in MS software for people to breach security, but its the thieves and vandals that are taking advantage of these holes that are the 'cause' of the problem.

If you take these people away the maybe MS could spend some time fixing bugs that affect day to day operational problems or god forbid improve the stuff.

If your house got broke into you wouldn't go looking for your locksmith, you'd wanna damage the burglar with the full knowledge that with a bit of effort you yourself could have picked your own locks.

If your car got stolen you'd want to hurt the thief, not Uncle Henry.

If you got stabbed you'd prosecute the assailant, not the hardware shop that sold the knife.

If your PC gets broken into you'd want to cripple Billy Boy, in every other scenario we'd go hunting the criminal element so why not the same for Bill's gear.

Hi,

I managed to get a setup EtherNEC/STinG running on my falcon under TOS
as well as MAGIC.
While testing, I identified problems with certain network cards.
The only stable setup for me was with a RealTek 8019 chip network card.
What card are you using?

it's seems harder to trace down where these thieves are at, and it seems
logical to "prod" the software giant to improve their product (put steel
cockpit doors on airliners). Anything to thwart net terrororism!

>However, the half speed bus is fine by me.

Am I correct in thinking that the 68060 internally doubles
the clock speed or does it also work without doubling ?

Anyway ,it inspired an interesting thought today...

Would it be possible to build a 68060 adapter for the Milan
that runs at 100MHz and retains the 25MHz bus speed ?

I doubt it would be as complex as the CT60 (but what do I know).
Could it be based on the original Milan 68060 adapter card ?

I have two new and unused Motorola MC68882FN33A FPUs for sale. I bought these in 1999 to upgrade my Falcons to run Linux and some
other software with. I ended up never using them because I purchased a Milan040 and installed Linux on my TT instead.

I am selling these for $35 each. If interested please E-mail me.

I should perhaps point out that this can only be used with the
original Atari control panel, XCONTROL.ACC, but definitely will
not work with COPS - with that the CPX's opening dialog sticks
and can't be closed, and you need the CPX active to use the
program :-(

It sort-of works with ZCONTROL and MagiC (opening dialog needs
MagiC's "tidy up" to clear it).

Apart from that it's very useful, both as a mouse speeder and for
allowing, say, double-clicks to be simulated with right-clicks.
Full details in the README of the bundle.

Regards, /Peter/

7060. Re: Forged Headers?

Newsgroup: comp.sys.atari.st

This whole topic used to fall under the topic of "fakemail". It requires a version of sendmail that will let you talk to it directly, and you continue typing header information in data mode, which usually prompts the receiver to use words like "apprently-from".

One typed "help HELO" to find out what sendmail wanted.

Today, that is known as an open server, or open relay, and the rest has the flavor of deja vu to it. And, it is used for what used to be called mail bombs.

Give it another 20 years, and there will be a new set of words for this, again.

Jim

The same thing happens here. I started N.Aes in both 030 and 68000 mode. It freezes. When I had an afterburner there haven't been any problems like that. After I installed Xaaes the problems disappeared.

Unfortunately I think that Xaaes is a mess.

Two separate configfiles, missing documentation. I would appreciate if Didier could get N.AES running with the ct60.

>Something very similar to this happen to me

You're twisting his words, he said "is a very expensive piece of
software if you just want to play .mid files". You even added a period
to his quote to turn it up your alley.

45 quid IS expensive if you just want to play with midfiles :)

BM> It was sold in 1984 by a company called Digital Research

It is free now. It can be download with sourcecode from:
<http://www.deltasoft.com/Default.htm>

BM> Work best on a 286 or lower...

It works on the Intel 80x86 architecture. I use it sometimes on a 486.

Hi Mark,
I'm not a prgrammer so I probably shouldn't comment here...but...:)
if it's made by man it can be broken by man! In part, I agree that the
burglers must be taken care of (with a good "stiff" injection!!!).
But, as banks do, an anti-burglary system helps so if another prgramming
language is better way to thwart off burglers then my question is:
How is Billy G. to be convinced as he hides behind his success?

>
>Am I correct in thinking that the 68060 internally doubles
>the clock speed or does it also work without doubling ?

No. It can run the bus at half or full core speed.

>Would it be possible to build a 68060 adapter for the Milan
>that runs at 100MHz and retains the 25MHz bus speed ?

Probably, although it would probably not be worth the effort - even with the
2:1 core:bus ratio, the core speed is already limited by the bus. For a 4*
clocked core to be useful, you would need to add L2-cache that runs at full
speed - I would guess that the effort would be the same or more than simply
adding a full-speed SDRAM constoller like the CT60 does.

>I doubt it would be as complex as the CT60 (but what do I know).
>Could it be based on the original Milan 68060 adapter card ?

Probably not. The original Milan adapter is mostly passive (it has a 3.3V
regulator for the CPU core, plus a very small bit of logic).

Maurits van de Kamp wrote on Mon 13-10-2003 11:24 (+0200):

>45 quid IS expensive if you just want to play with midfiles :)

If you actually only want to _play_ MIDI files on an Atari computer
without any extra cables and synth modules then try the free Phplayer by
William Wong. It plays MIDI files through the internal speaker as long as
they are not to overfilled with events. It uses Gravis Ultra Sound sound
samples to generate the wave forms and sounds surprisingly good via DMA
on my TT.

From the README:

PHPLAYER 4.6.1
==========
DMA Sample player for STE, MSTE, Falcon & TT.
Supports MIDI, MS ADPCM WAVE, IMA ADPCM WAVE, AVR, VOC, AU, SND,
AIFF, IFF. VA-protocol, Drag&Drop protocol, multitask aware, ACC/PRG.

I think we've spun way beyond the point. If the software is faulty, it is. A hacker can't exploit a hole that's not there.

To be perfectly honest, I don't really care if Microsoft ever fixes their operating systems, I really don't. Slowly but surely I'm moving over to Linux anyway.

The lawsuit was inevitable. People are tired of losing time and money to security issues that should have been fixed from the start. XP is based on the 2000 or NT engine isn't it? I mean, when they spout that it is stable and secure, you kinda want to believe them.

Is your house secure if you leave the door wide open all night? Well, I guess if those pesky thieves would just go somewhere else.

Tony

That is a pretty good deal for Cubase, I'll admit. Your pages say
'Cubase v3.1 from ï¿½99' though.

But I have to say, if I'd just want to playback a .mid file, Cubase
would be OTT, and 45 (or 99?) quid would be a lot of money. OTOH, if I
was looking for a professional sequencer, I'd definitely consider it.
(If it wasn't for the fact that I am a Logic user)

OK. So I stop locking my door when I leave my home. Then, a thief
steals everything of value. Who is to blame? Both. But criminals will
always exist.

> If you take these people away the maybe MS could spend some time fixing bugs
> that affect day to day operational problems or god forbid improve the stuff.

Well, 15 years or so has passed since the first version of Windows.
How did they spend this time?

For example, Microsoft practically invented the email virus by
allowing scripts to be run from email messages. This was an obvious
security risk right from the start, and they received much critiscism
for it. However, they still concidered it to be a great feature, and
what happened?

> If your house got broke into you wouldn't go looking for your locksmith,
> you'd wanna damage the burglar with the full knowledge that with a bit of
> effort you yourself could have picked your own locks.

Definitely. However, what if the locksmith gives you the impression
that you have an extremely secure lock and it turns out to be crap?

> If your PC gets broken into you'd want to cripple Billy Boy, in every other
> scenario we'd go hunting the criminal element so why not the same for Bill's
> gear.

Some of the "greater" viruses has been created by minors, btw.. This
is usually not big criminal organisations or master minds, just kids
testing boundaries.

I see your point, but it is not really comparable to the things you
mentioned earlier (being stabbed etc). This is about a coorporation,
selling a product that they claim is secure when it is really not.
And it is dangerous.

Bonsoir :)

Next bugfix for Meg 1.2. Apologizes for these too many
updates, but the spams are becoming more and more vicious.
I'm losing hope about leaving the development of Meg, to
concentrate on a gem game for Xmas.

Therefore:
- bugfix of 'From', 'To', 'Subject', etc detection failure if
they were in major case (fool trick of spams). Detection of the
fields of the mail header is now case unsensitive. With this bug,
the spams were always accepted if some friends were declared.
(Thanks Kenneth ;))

http://www.atariarchives.org/cfn/12/05/03/0267.php and
http://www.atarimagazines.com/startv4n3/smalltools.html have some details.
From memory (and above links) this error occurs if the file is damaged. Also
can occur if it is write protected, i.e. it is trying to execute from cdrom.
I have had this problem on more than one occasion, in the instance of the
cdrom, simply copy the files to your hard drive/floppy drive and change the
attributes to read/write then it should be OK. For a complete list of error
codes look here
http://atari.games.free.fr/atarist/_dossiers_/dev/devdoc/bombs.html. Google
for ever:-)

Works great now.

You did mention that only the first 2 kB of the header was searched for
"From: " and "Reply-To: ". I have got a few mails (from Yahoo atari-midi)
that were detected as spam.

The reason seems to be that the header is longer than 2 kB and "Reply-
To:" appears at the far end...

Because or that the Friends setting for this mailing list sometimes fails.

Is this short buffer present in this version as well?

I had a look at the sources and found indications of a header buffer of
4096 bytes so maybe the buffer is longer now?

> that were detected as spam.

The 'Reply-To' field is not used by the filter. Only 'From', 'To', 'Cc',
'Subject', with the message body and mail size are studied.
Do you want me to take care of this field ? (and search for friends in it
?).

> The reason seems to be that the header is longer than 2 kB and "Reply-
> To:" appears at the far end...
>
> Because or that the Friends setting for this mailing list sometimes fails.

Have you declared this 'Yahoo atari-midi' as a mailing list in the friends
table (if mailing list, the 'friend' is searched in the 'From' field) ? Can
you send me a zipped mail to study it ? Thanks.

> I had a look at the sources and found indications of a header buffer of

Oups, I forgot to tell the buffer size for header and body were increased to
4096 for both.

FamilyNet Newsgate

I have a TT 030 that I am thinking of making use of. What are some good programs for for running a BBS? And importantly, which BBS has the best variety of online games? I want to run as many as possible. :)

(Here in the Dallas area we have examples of PC and Amiga, figure the Atari types need to made available.)

A side thought, did a BBS ever make use of X-Former so that Atari 8-bit games could be ran as well?

Thanks!

Clu

The shipping of the 060-100 and the 100 MHz OSC will be done tomorrow for
the developers who sent me the 060.
Shipping too of 3 other CT60 : 2 for Germany and 1 for France.

BIG THANKS to Didier Mequignon who add a nice idea and find my problem with
the new OSC...

Didier, the way is open to test over 100 MHz !! ;-))

7110. Folder attributes in TOS

Newsgroup: comp.sys.atari.st
Date: 2003-10-19 12:42:00 UTC
From: vdjole@EUnet.yu
Message-ID: <bmu0qm$326$3@news.eunet.yu>
Source record: 23141

Hi;

Something which I have been working on made me wonder how does the matter stand with using folder attributes (hidden/system/readonly) in TOS (FAT) filesystem? The built-in desktop of TOS ignores them completely (or wrongly interpretes them), but another desktop or fileselector can, or may be made to, respect those flags. "Readonly" is a bit more complex because, in my opinion, setting a folder to "readonly" should effectively prevent any writing to that folder or to files in that folder, which could be very handy to protect important files from accidental destruction by oneself.

Currently I am not interested in other available filesystems with more sophisticated file/folder attributes, but only in knowing are there any fundamental reasons for not utilizing -what is already there- in the TOS/FAT filesystem. And, is there perhaps some patch/utility which adds this functionality to GEMDOS withut too much additional bells and whistles?

thanx;

7112. Aniplayer as CAB plug-in

Newsgroup: comp.sys.atari.st
Date: 2003-10-19 15:42:39 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3f92beeacde8c0@tripnet.se>
Source record: 23144

I can't get Aniplayer to act as a plug-in in CAB and for example display the examples at the Aniplayer homepage http://perso.wanadoo.fr/didierm/ . I know this did work in the past but now something is wrong.

CAB actually downloads one of the .mov files but Aniplayer does not seem to care.

Setup is latest versions of Magic, Jinnee, CAB, Olga and I can't find anything wrong with how things are setup. After all it is not too complicated to setup MAGIC.INF and OLGA.INF correctly for this use. I have setup Aniplayer as "help program" within CAB. OLGA.APP is up and running.

Is this working for someone else with a similar setup?

Source record: 23145

Kenneth,
Inside of CAB, under OPTIONS and EXTERNAL VIEWERS.
Did you setup .MOV to be recognized by ANIPLAYER???
You must tell CAB the EXACT directory that ANIPLAYER
program resides and have CHECKMARKED SUPPORTS VA START
for Aniplayer to be used and recognized by CAB.
Notice also under EXTERNAL VIEWERS that there are MANY
other file formats that can be defined to have
specific programs that you want used to deal with
certian file extenders. Let me know if this helps
there maybe a setup issue with Jinnee that may need
dealt with as well.

Thanks,
Carey Christenson

All set and if I open a local or direct url .MOV file from within CAB
Aniplayer launches and play the file.

>there maybe a setup issue with Jinnee that may need
>dealt with as well.

A right click in Jinnee on a .MOV launches Aniplayer so I guess that is
correct as well.

I did look through my Olga settings and they seem OK. Strange.

>I did look through my Olga settings and they seem OK. Strange.

Got it working now!

The "error" was within OLGA.INF and hard to see... I found trailing
spaces after most of the Aniplayer related lines. Deleted all those
spaces, terminated Olga, started CAB and now the plug-in demo at the
Aniplayer homepage works.

I'm definitely not responsible for those stupid spaces. Perhaps the
Aniplayer installation program?

Still no luck with "embedded" mp3's and ogg files... But wave and MIDI
works using PHPLAYER.

Just got hold of a mega st 1, though I don't have anything to view it on yet, I'll get/make an adapter for it, until then though, a couple of questions....

It has a battery compartment, what's it for (no manual)

On the bottom sticker, it says mega st1 NT (whats the NT for... I saw a mega ste on ebay that was advertised with the nt moniker also)

Are they easily upgradeable memory of hard drive wise, I realise you plug megafile in the back of it, but these arent that common in the UK, and those that are, cost a bomb (which I'd prefer not to pay), if there is an easier way of getting even a tiny hard drive working, that would be great.

Finally, I see it has an expansion slot in the back, I know you can put a pc emulator card in it, what else can go in it (just curious)

Thanks.. Rob

7120. Need a VME graphics card for a TT... Anyone have one?

You could get an Adscsi controller to fit in the drive internally, bit I never actually saw one. You are pretty much right, megafile or an external scsi drive and host adaptor. You could fit an internal IDE drive using mario becrofts adaptor http://gem.win.co.nz/mb/atarihw/ide.html or If you are clever enough http://www.joogn.de/atari_ide.html. Ram upgrades are a problem but you can go to 4 meg using the extra ram deluxe board that uses standard simms, the trick is finding one, or again http://atari.nvg.org/stacyram/index.html. Not all of these hacks are for the MegaST, but are easliy adapted.

> Finally, I see it has an expansion slot in the back, I know you can

http://www.backntime.net/Atari%20Computers/16bit/MegaST/FrameMEGAST.html some more info on the MegaST, the expansion could have a ram upgrade, scsi card, video card, PC emulator. It is essentially an internal BUS connector.

Mark

Thanks for the info Mark, I pulled the batteries out coz they looked
like they were about to leak...ah well, I'm sure it's not too
difficult resetting the clock.
I have contacted mario before (vme graphics card - galaxy) but got no
reply, so unless someone else sells the hardware, I'm a bit stuck.
(The adapter would do just the trick too have a nice 500mb drive that
would go in there... I'm not brave enough to attempt the DIY version)

I have a similar setup on my Hades060. I use Magic mainly with
Jinnee 2.5 and Cab. When I download a file with the extension I
have chosen for Aniplay (wav,mov,etc) under Cab, Aniplayer is
brought up and the file is played (or at least Aniplayer tries to
play it).

Yes, I forgot to mention this. You must do as Carey says or else
Aniplayer will do nothing. The same would go if you wanted certain
picture files to be loaded also.

There was a player for the Atari 8-bit that came out that played
sid files. The package contained the player as well as a ton of
sid files from various games. I have it somewhere. I just have to
look around...

Andrew Hodgson wrote:

> No, I want to know what sort of music the Atari supported in games et
> al. For example, Amiga = mod, C64 = sid, etc.

MOD originated on the Amiga and SID-files obviously originated for the C64's soundchip, but both of them were eventually used by any platform that was technically able to play them, including the Atari ST.

As for an Atari origin, I guess YM files belong to its YM soundchip. :) But games used all sorts of chiptunes as well as trackerformats (including MOD and SID of course). The only really Atari-specific thing I can think of is Ace tracks (Falcon only), but that might be a bit too recent for you. :)

Ace is a software synthesizer for the Falcon that can be used with MIDI but also comes with its own tracker. Gradually, Ace tunes are being used in demos and as entries in tracker competitions (it certainly was a nice new dimension to Error In Line 2003) :)

Maurits.

Hello

I have some docs about a C library which are in SGML format. Is there any app to read them with an Atari? any MiNT ported tool?, or any tool to convert those docs in a format readable by my Falcon.

I found a SGML parser but after reading the documentation i dont think i can view anything with it, only check that they are good.

Thanks.

From what I know Mario stopped working on this a little while ago
because the guy whom was helping him code up the graphics driver
disappeared and he's not had time to get back into it.

Alan.

Hi Martin,
From what I understand the SH204 (20 meg drive) is a little different
from the Megafile but I boot my megafile30 with HDdriver. It may work for
the SH204.
Start the SH204 first and wait till it spins up (give it a minute) then
start the computer and run HDdriver from a floppy disk. If it works you'll
see 1 or more partitions booted (if there are any).
Then run HDdriver.app from a floppy and select "boot from drive C"
and click on "Install HDdriver". Then put HDDRIVER.PRG in the root
directory of partition C and rename it to HDDRIVER.SYS. Also, remame
(disable) AHDI.PRG in the AUTO folder or SHDRIVER.SYS in the root if either
program is there. Don't delete them yet :) If goes well then the next time
it will boot from the SH204 (assuming the drive is good and there are
already partitions on it).
You can get HDdriver demo from Uwe Seimet's site (not handy right now).
The old way is with AHDI/HINSTALL but I had no luck with it.
Another note is that the SH204 must be put last in a chain of multiple
drives (SHs and/or megafiles). Also, in my manual for the megafile there
are references to DIP switches that I'm not familier with and you may not
need to know anyway.
comp.sys.atari.st always has helpful people including Uwe Seimet who
will probably give advice.
Let me know how it goes!

John

From: maraka@atari.net
Message-ID: <d385a14d.0310202356.430c3557@posting.google.com>
Source record: 23019

Hello Frank

I have found another situation that freezes N.AES, itï¿½s involved
again the
keyboard, you asked me in DHS CT060 forum about my keyboard. What kind
of keyboard interface do you use?

With COPS open BubbleGem CPX module then try to change the open/close
times
values for the bubbles and N.AES freezes again

If you use COPS and BubbleGem could you try this to see if also that
hangs
your N.AES.

Is the email address showed in your posts valid?

Hi all.
I hope this is the right place to ask.
(I wasn't able to find FAQs about AtsriST)

I have my old ST floppies which I cannot read anymore
(mostly source code).
I'm looking for a way to read them using a Win2k PC.

Cheers
Emilio

FALSE !

The bus interface of the 060 allows FULL, 1/2 or 1/4 speed bus of the
internal speed.

CT60 uses FULL mode and is the only one design on the planet to use that !
As I know all designs using 060 were designed for 040 and so use 060 in the
1/2 bus mode !
Like for Milan and hades !

But it is easy to design a 060 daughter card for milan and hades with 1/4
mode !
A 25 MHz Milan bus can dialog with a 100 MHz 060 with 1/4 mode !!

E41J is very difficult to find at a good price !
Sure you can buy it at motorola distributors ... around 600 $
eh eh ;-)

If somebody find an other way....I want to know !

I was lucky to find 25 exemplaries of this 060...
I don't know if I will find others...

It is more easy to find old 1F43G because it is pulls from old systems...
But E41J was produced after 1999 and so is surely in active systems... no
pulls...
And new is so expensive...

It is why I consider atari world has to move to an other processors familly
!
Imagine what kind of PowerPC CPU yyou can buy with 600 $!!

Hey all,

I'm selling a shareware disk library.. It includes over 120 disks, each one containing programs in a particular category (Utilities, Games, etc). Many of these programs are really fantastic and hard to find. There are also several disks with demos of popular commercial programs from back in the day.

I'd like to sell it to someone who will enjoy them. I'm asking $15 plus shipping.

If you're interested, just email me at:

It's just a wireless serial port link utilizing bluetooth for the wireless
link. I doubt we would be able to access other bluetooth devices such as
cell phones or keyboard/mice.

Mark

7156. RAM Filled by CAB?

Newsgroup: comp.sys.atari.st
Date: 2003-10-22 16:24:53 UTC
From: swamptaxes-NOT-@atlantic.net
Message-ID: <pbylb.940$In4.651583@monger.newsread.com>
Source record: 23038

Hi All,
Is this a CAB bug or something else? This happens but rarely:
(note that this is a Falcon with single TOS 4.04)
It looks to me like RAM (14 meg) is getting filled but there's not that many bytes downloaded. This is not the usual "run time error offset" crash. With this, a page gets loaded but CAB stops loading pics even though CAB Cache shows plenty of RAM left and I know there should be at least 8 meg RAM free. There's also plenty of hard drive space. It can happen on the first or second web page downloaded. I can call up the control panel but can't open General.cpx to see RAM status! Then when I close CAB there's 0 bytes in the Hotlist file!
Another odd but possibly related problem happened when trying to get Sting to connect (I usually use Stik2). After playing around with scripts, etc., my Control.inf on drive C got reduced to 0 bytes so had to boot from a floopy until I found the error.

John

�Imagine what kind of PowerPC CPU yyou can buy with 600 $!!

Well lets thinks about that :
<<...produced after 1999 and ... in active systems ...>>

They are fully used in big routers for ISP or big companies as far I knows.
These guys knows that slower CPU add costs to them, but uses 68060.
If newer CPU were faster they would uses it, but they uses 68060.

So why moving to other CPU that would just be todays fashion ?
I don't care about Mhz, I just want power.

Actually we Have the Hades wich cpu bus is at 1/4 and CT60 with cpu bus at 1/2
of CPU speed (dixit Czuba tech). If we wanted a faster computer with 68060 we
could have a faster computer with bus running at same speed than CPU like in the
routers.
68060 may look old but is it a CISC CPU after him ?

That chip will be outdated when routers will works with other chips. Managers
that uses 68060 in there companies knows what they get from many chips, so if
they choose it its because it is the best.

Any different opinion are welcome.

But Gemulator itself does. I use it a lot at work to run a (sort of)
company critical Atari app.

Should be set to "Atari disk mode" for best compatibility.

>but I got it running on a Win98 box !

In the Windows world you often need a multiboot setup for some programs
that can't cope with some Win incarnation.

Nice to be on a platform where often the same physical applications can
be runned in TOS, Magic, Geneva, Mint without multiple separate
installations...

You are using Newsie and in the past there have been several file
corruption reports by Newsie users. I seem to recall it can be cured by
turning off some logging functions. Sorry, I don't use Newsie myself.

Hm - interesting, I did not know about 1/4 mode.

>But it is easy to design a 060 daughter card for milan and hades with 1/4
>mode !
>A 25 MHz Milan bus can dialog with a 100 MHz 060 with 1/4 mode !!

Hm - yes, that might work. However, it will not bring much speed improvement
- even in 1/2 mode, the bus speed is already limiting the CPU (which
explains why the CT60 is faster), so clocking up only the CPU core would not
bring much real speed.

With no offense to Gamer, and for Mario since I like them both; don't waste your time. I tried to write Mario a while back. Tried multiple times. No answer.

If someone has heard from him lately, awesome. But back when I was shopping for a card, and his sound good, he didn't reply to my questions.

Sounds good to me! Unless the ST had some funky character set like the
Atari 8-bit's ATASCII

> �A side thought, did a BBS ever make use of X-Former so that Atari 8-bit
> �games could be ran as well?

> What is xformer ?

I would say a brillant 8-bit Atari emulator that worked fairly well on the
slower ST's. I would say it, but Derek M, the programmer, would say all
this for us. :)

All the same, the emulation ran appplications fairly well. Also had 1050
floppy disk support.

I keep Newsie in it's own folder which seems to keep file corruption
within the folder (actually adds merged corrupted files which Diamond Edge
takes care of farely well....((if no long file names)). The problem I was
speaking of seems to be related to CAB, the CAB_JPEG module or CAB calling
on the JPEG loader in the AUTO folder (just guessing) and it is a rare
occurrance but annoying none the less.

Hello,

this file is necessary to display alternative AES fonts using GDOS and VDIFONT. Unfortunately the memory.sys that comes with FONTGDOS sizes more than 50 kB and thus needs too much space on my Atari boot disk for x86 PC's. NVDI's memory.sys is much smaller (< 2 KB) but I must not distribute this file with my disk for NVDI is not free. Can anyone help me? Please have a look at your gemsys folder for the memory.sys, and if it is free send it to me.

Thanks, Ludwig

From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <kI%lb.32326$h47.3147@bignews4.bellsouth.net>
Source record: 22952

I've been a Gribnif User/Fan since the very early releases of NeoDesk.

Always wanted a Crazy Dots board...they were just WAY too expensive for a 19 year old college student (back when they were avilable).

CardFile, in all its simplicity is still my addressbook of choice *even over the bloated Windows stuff that's really nice, but very difficult to import and exchange across platforms for database and spreadsheet work*.

Geneva is a God Send...mainly because it has not changed much since the inital, and very well done commercial release. I frequently fall back to Geneva because it gets along so well with most legacy apps, such as Steinberg's suite of software designed around MROS. The fact that you can EASILY control how much memory (and other odd bits, flags, and paramaters) a particular app can grab keeps me going back to Geneva again and again.

I'm also an N.AES and MagiC user/fan. On my CT2B Falcon...these products ROCK when running later generation software that knows how to behave under a multi tasking AES...but lets face it...there are a LOT of really fine programs (at least in function...maybe the code is multi-tasking-sloppy...but at the time it didn't matter) that were done long ago and never got past version 1. To date, Geneva is the easiest, fastest, and most likely AES to set up and successfuly run such apps.

NeoDesk 4 is sweet...if only it could deal with long filenames. Yeah, these days it's just too easy to keep a load of VFAT DOS Formatted ZIP Disks around for portability :) The long file names would be very very nice ;) Also...as it becomes harder and harder to find hard drives under 20 GIG!!! one runs out of room for partitions pretty fast....so ext2 partitions come in handy to claim alot of that space for backups and archival....again...the long names would come in handy. Not much market left, so I wouldn't blame ya for not investing too much time in this...also alot of competition in desktops now (NeoDesk started it all!).

As for a REAL WISH that I'd like to see Dan consider.....
To date...there is NOT A SINGLE Decent vt102/ansi GEM terminal in existance that can tie in with a TCP/IP stack (telnet)! STalker is a very good COMS package that uses GEM and has some of the FASTEST and best looking screen emulation done to date for GEM. TOSWin is the closest thing in existance to what I'm talking about here...and it ONLY WORKS with Mint...has bad and buggy screen emulation *yes, no matter what TERM caps/infos you use...then dern thing doesn't scroll properly, is jittery, not really VT100, etc...

To get a decent VT102/ansi color emulation over the net...about the only option out there is Teli for MagiC and that oddball TCP/IP stack that comes with CAB, or Draconis. Hmmmmm....okay, this Teli is well done, looks great, and it WORKS,

but it is orphaned (or was last 3 times I tried to register it). By the time you go around the world to get it working with a TCP/IP stack (Some converter for STing, or moving to one of the oddball TCP/IP stacks), it's dog slow...even on a 50mhz Falcon!

I'd love to be able to do simple ports to things like tinyfugue, pine, etc...that don't require all the MiNT extras. The lack of a decent ready made terminal is the FIRST and most obvious barrier to making loads and loads of simple text based clients that are easy on the eyes and quite powerful. STalker is there...and the emulation is quite good...lets just get it on the net ;)

Quite simply put....
A top notch, speedy, and well functioned COMMS package that can get on the net is the MOST IMPORTANT application there is...it is a gateway to anywhere and anything...even the lowliest 520ST can make a great dumb term to a unix shell. Sadly, this is something we still don't have on the Atari.

Dan....
Please please consider popping in support for a TCP/IP stack (STing would be ideal...as there is gluestick and Ifusion to easily tie this into Mint/Net or MagiCnet...Also, STik/STing works just fine on low memory/slow machines with NO multitasking support) into Stalker, and/or, offering a simple shell where STalker can run tos/ttp command line apps in a VT102/ansi/color window...handlers for MiNT tty info would be kinda nice as well...but at the least...just give us telnet somehow ;)

I'll PREorder 3 copies TODAY if you'll do this.

Brian

Yes, I know. To be able to able to establish a connection towards a
bluetooth enabled PDA or similar will probably need some kind of
software support. I just it would be a nice cable replacement for us
geeks.

The company that makes them is about 100 meters from where I work. I
will pay them a visit and find out how it works. The have lots of
other interesting bluetooth related stuff too.

Source record: 22959

I just thought I'd mention that I wrote a letter to the editor of the US-based "COMPUTER SHOPPER" magazine last month regarding a story they did on PC manufacturers getting away from the "beige box" look of the typical PC case. And they published my letter in this month's issue (November 2003).

The original article was in the August 2003 issue, and was called "The Shape Of Things To Come". The story featured different types of cases, and various other non-standard PC designs. And there was one design, in particular, that all of us here would recognize; a wedge shape, with everything built in, including the keyboard, and all the internals.

Anyway, my letter I sent them is below (the version of my letter that's printed in the magazine has been edited and changed a bit, but the main idea is still there)...

Check out the magazine if you get a chance. My letter is on page 11, in the top left corner.

******

Your article in the August 2003 issue "The Shape Of Things To Come" was a good read, and it's nice to see PC designers getting away from the beige box look. But the "Cybernet Zero-Footprint-PC Elite 4" should be referred to as "the shape of things that were". While the concept for the PC platform is innovative, the design itself owes much to Atari who created a similar "all in one" unit more than a decade ago with their Falcon030 (and before that, the Atari ST, Amiga, and even the 8-bits of the '80s had a similar look). But I guess to most folks who've only ever used a DOS/Windows box (and apparently to the author of that part of the article, Nancy Feldman), this is an entirely new idea that boggles the mind.

Would it be faster ? Or would the 68060 spend most of its time
waiting for data from the bus ?

Well... I can almost guarantee there is or could be some sort of back door
into the bluetooth interface. If the company released the specs we could
go crazy with the device. That's a WHOLE different story ;-)

Hi Paul,

Well said me finks! The "indestructable" "TOS IN ROM" cures most system crashes and virus's, now why did I think of putting windoze in a rom ;-) I always thought the ST had many good ideas over the PC, I hope things will come around and the ST deisgn will come back into play, if only to relax from all those stupid PC virus!

Some of us still uses Thing v 1.27 because there is no way to get the
newer 1.29 version. :-(In the past I've ask the programmer of Thing
several time if he please could send me the latest release. Never got an
answer back.
Just like Peter I do prefer Thing over Jinnee. In some ways it's better
then Jinnee too.
Anyway I hope Thomas will eventually release V1.29 (or v1.30)
>
>> Does anyone else use large FAT32 partitions with Thing ?

Indeed, ext2 is very good. I never have used FAT32 so I don't know how
its behave but with ext2 I do have a few problems. Some programs doesn't
work very good with an ext2 partition. For instance Image Copy can't load
a picture if I try to load the picture which is located on an ext2 by
means of drag/drop.

CU,
Martin

Someone told me to increase the size of the Mint IO cache.
I added CACHE=500 to the mint.cnf and the IO errors stopped.
Sorry, I forgot who suggested it.

There does seem to be some other problems with copying
large numbers of files though.
```

I tried to copy the entire content of one partition to the
new disk and it fails part way through. I had to use
the Unix cp command from a Mint TOSWin console.

Also, Thing thinks that the 5Gig FAT32 partitions are only
1.5Gig Jinnee reports the correct size but I prefer Thing.

Strangely, the size of the ext2 partition is reported correctly.

Does anyone else use large FAT32 partitions with Thing ?

Regards,

Peter

> i.e, better than Amiga Mod tracks? Is there anywhere to get samples?

Well, if you are talking about built in hardware comparisons...I think the Amiga supposedly has a more advanced, coustom done chip-set. What little experience I have with Amiga is limited to a 2000HD system I recently aquired. Still learning about it. Obvious differences are that the Amiga is stereo ready.

As for the Atari ST...it uses a standard 3 channel yamaha chip. The ST came with only a mono lead built into the monitor port where all 3 channels are mixed. There were some hacks such as the Tweety Board that simply divide the 3 channels into 3 seperate RCA phono jacks while locking the signals into normal hi-fi line levels.

The ST sound chip is 8bit with 3 channels and offers a pretty interesting set of synth features from what I understand. I'm not sure what the highest sample rates supported are.

If I understand correctly, one of the strongest points of this Chip and the way it is incorperated into the ST, is that it could access the memory directly and free the main 68000 processor for other things. Maybe I'm confused, or maybe that is in STe/TT/Falcon models only...but I vaguely remember something about DMA sound with the ST or STe.

As with most 'tools'...I dare say either machine is pretty awsome in creative hands :) I've heard musical masterpieces done with a cigar box and a rubber band ;)

The Falcon has the same Yamaha chip in it for ST compatability, while it also gets a 16bit DSP that is quite useable in the 44.1 to 50something mhz zample rate range (tuned for compatability with the DAT and ADAT standards at the time Falcons were slated to be built). The DSP is highly programable for special effects and digital processing.

My current understanding is that the Amiga lines offered a good deal more in terms of stock audio and video hardware that got built into the machines. One should also keep in mind however, that the STe cost less than most Amigas past the A500...and maybe was even priced below the A500?

Not much, and perhaps not fully correct....but at this point it's all I know to offer.

Brian

I really, really, REALLY, want to buy an Atari Falcon computer, but it's
almost impossible to find someone selling it (in the netherlands)

Is there someone on this list, who might help me?

Marius

7192. HighWire 0.1.5 is released

Newsgroup: comp.sys.atari.st
Date: 2003-10-26 21:36:29 UTC
From: GokMasE <fake@email.se>
Message-ID: <Usenet.gbbaiehc@localhost>
Source record: 22974

The open source browser HighWire has had another update,
and this time the changes are rather significant:

Clearly the most exciting change is that HighWire finally is capable of
viewing JPG/PNG graphics, and that the program now is able to download
and display images via remote connections!

In addition to this, HighWire is also able to store image bitmaps in
RAM to speed up the handling of graphics. Eg. swapping between pages
stored in the cache can benefit enormously from this! If not specified,
HighWire will use 100kb. It is important to point out, that if you
visit graphic intensive pages HighWire may have to spend time flushing
the cache memory over and over again if the cache memory limit is set
too low.

(Please refer to highwire.cfg on details how to set this up)

Other interesting changes includes improved dithering and added
support for 32k screen modes as well as better support for TrueColour
and GrayScale. There has also been an optimisation of the cache scheme
that lead to reduced flickering upon image rendering. Finally, a
correction in the calculation of cache size for disk cached objects
was made, and a bug causing the program to enter an infinite loop
(when writing to the cache failed for some reason) was fixed.

Upon request from several people testing previous HighWire releases, it
is now enough to just enter eg. "www.atari.org" instead of "http://www.
atari.org". Keyboard shortcut CTRL+N will now opens a new (empty)
browser window.

To download the new release and read more about the project, please
visit:

http://highwire.atari-users.net

We hope that this new release will be useful, and also want to
encourage everyone to keep submitting bugreports and feedback!

Thank you,

HighWire development project

7193. CAB Runtime 205 ERROR with CT60!

Message-ID: <1067194390-943984AEicMi@adelphia.net>
Source record: 22975

Anyone with a CT60,
A couple of weeks ago I posted this message and
recieved NO bites so I am re-posting in hope that
someone out there has had this problem and figured out
how to fix it. I have been working to try and help
him but with NO success. He has been able to surf
with his Falcon using HIGHWIRE so with the recent
release with PICTURE support it will be much nicer as
well. BUT CAB is still needed to do GOOGLE searches
and such. Soooo, anyone out there know what is going
on with a RUNTIME 205 ERROR??? Here is the post that
I put out there 2 weeks ago:

A friend of mine came down to recieve help with his
installation of his CT60. After getting everything
installed hardware and software wise. Upon booting
CAB he gets a RUNTIME 205 error both in 060 mode and I
believe 030 mode as well. Anyone else with a CT60
experiece this problem and if so what was the solution
that fixed the problem???

Thanks,
Carey Christenson

I'm interested in purchasing an Atari Stacy if the price is right.
Please reply here or e-mail specs,condition of unit, and asking price.
I am located in North America, but would consider offers from just
about anywhere. Thanks.

Most people used Atari XL/XE in those days..:) As for the ST it would have been mostly chiptunes (YM probably), I think it took a while before MODfiles (or any other format with samples) were played properly on STs in games.

Actually that is a funny development, looking back at it. Now when you look at PCs, a PC gradually becomes slower and less powerful when you keep using the latest software, because the availability of new hardware makes programmers more and more lazy and less efficient. But when you look at ST games, at first the programmers just didn't bother to try and play samples on the ST's soundchip at all, and then later samples were only played during a frozen intro screen (and you shouldn't move the mouse or it would slow down playback), and then gradually there were ST games that could play modfiles during gameplay. Somehow the STe (that could easily play samples with audio DMA) stimulated programmers to get more power out of the non-audio-DMA ST. Ah those were the days. :)

Maurits.

> DMA sound with the ST or STe.

You're confused, but only slightly. :) The ST has the Yamaha soundchip
that is really only made for beeps, but with the right programming can
be "abused" to play samples (depending on the software, it can come up
to around 20KHz). The STe and TT have an audio DMA chip that can really
play samples (up to 50KHz) without processor intervention, directly from
memory. These machines have a stereo output (2 cinch connectors) on the
back.

Maurits.

7204. 3.5" DSDD ("720K") diskettes

Newsgroup: comp.sys.atari.st
Date: 2003-10-27 19:13:37 UTC
From: "Glen G." <novirusforme@nowhere.com>
Message-ID: <E9udnX9eRpsa8wCiRVn-gw@gbronline.com>
Source record: 22986

Hi --

I have a number of old computers which require 3.5" DSDD diskettes and recently had an opportunity to purchase some of them (more than I will ever use, but I had to purchase the entire lot). A friend suggested that I post to a few Usenet groups pertaining to machines which have the same requirements -- somebody else probably could use some of these, too.

Here are the details:

Retail 10-diskette boxes, Certron brand, shrinkwrapped, inner plastic sleeve, labels included. Look and act just like brand new. I opened a couple of boxes and formatted half a dozen diskettes without incident.

They're packed in a couple of different-sized cartons: 10-box and 42-box. Cost: $1 per 10-diskette box, minimum 10-box order (one 10-box carton). USPS Media Mail is the best bet for shipping: $3.52 (for a total of $13.52) for a 10-box carton (100 diskettes), and $8.74 (for a total of $50.74) for a 42-boxer (420 diskettes).

If you prefer, I can ship via UPS, but it costs a few dollars more.

I'll ship them from my company address, so I can accept PayPal, VISA, MasterCard, American Express, or Discover. If you have another payment option in mind, please let me know.

If you want in on this deal, please send a note to glenatacme@aol.com. I'll reply privately and if you're in the USA I'll include my toll-free number so you can call and we can discuss the details.

BTW I'll be happy to ship internationally.

Any questions drop me a note at the address mentioned above.

Later --

Hi.

Does anyone know of a UK source for the MCCS146818BM clock chip ?

My Falcon clock battery died a couple of days back,and so far the only option that seems open to me so far,is to replace it with one from a broken motherboard. Not really a good idea, but a last resort solution, since most Falcon clock chips will now be reaching the end of their battery life.

Cheers,

Paul.

Dallas DS12887 is a direct replacement for the Falcon NVRAM chip.

Maxim are the distributors and their web page has a form where it's possible to request samples.

Otherwise you can get this chip from RadioSpares.

> My Falcon clock battery died a couple of days back,and so far the only

The top of the chip can be opened to reveal the coin battery inside, so as a last resort!

7218. Ethernet Networking?

Newsgroup: comp.sys.atari.st
Date: 2003-10-29 16:10:35 UTC
From: Larry@unicode.com
Message-ID: <4bdbad34.0310290810.4188f022@posting.google.com>
Source record: 22800
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st,comp.sys.atari.programmer

Hi All

I am hoping to get true ethernet networking on my Falcon and my TT. I am having a hard time finding a 'step by step' guide to implementing this using the built-in TOS, and harder time finding out how with alternate OS's that I can't seem to get much data on (MultiTOS, MiNT, MagiC).

I did find a couple of VERY simple ethernet interfaces that seem ideal to the task (they are so simple that the Atari 8-bit forums are using them with the 8-bit cartride port!) The links are:
http://www.embeddedether.net (about $50.00US)
http://www.embeddedethernet.com (about $70.00US)

Is there anyone in the 16/32 bit community that is familiar with these and/or has implemented them?

Is there any site that has a 'step by step' guide to getting an ethernet connection up? How about for file and printer sharing (Windows SMB, NFS, LPR) and/or internet access for downloads (ftp, ssh)?

Has anyone used the 'LAN' port on the Falcon or TT to get netowking up with Linux (or other OS)?

Is there a more appropriate forum for these questions?

I have spent quite some time searching the internet, have I missed some usefull sites (probably...)?

I really want to get my Atari's talking to my Linux and Winblows systems, I have a Linux RAID 5 server with DAT backup and that is where I want to store most of my working files and software backups.

Larry

I'm not familiar with the interfaces to which you link, but there is a
project that provides Ethernet via the ST/TT's cartridge port or the ACSI
port:

http://home.arcor.de/thomas.redelberger/prj/atari/etherne/index.htm
http://hardware.atari.org/ether/index.htm

> Is there any site that has a 'step by step' guide to getting an

There's lots of software for doing many of these things, but I've not yet
dug into them much, so I can't provide specific pointers.

> Has anyone used the 'LAN' port on the Falcon or TT to get netowking up
> with Linux (or other OS)?

AFAIK, those ports are useless as anything but high-speed serial ports; to
the best of my knowledge, nobody's written any software to let them
function as network ports.

> http://www.embeddedethernet.com (about $70.00US)

The best solution atm. seems to be EtherneC device, see:
http://hardware.atari.org. It contains drivers for STiNG, MiNTNet and MagiCNet

> Is there any site that has a 'step by step' guide to getting an
> ethernet connection up? How about for file and printer sharing
> (Windows SMB, NFS, LPR) and/or internet access for downloads (ftp,
> ssh)?

For MintNet setup is similar to Linux (Unix in general) setup. For MagiCNet
it is Unix-like too IIRC, for STiNG it is diffrent (there are guides in the
STiNG package)

NFS and SMB filesharing is possible under MiNTNet, I do not know about
pritersharing, but should be possible too. Internet acces is not a problem
(all standard apps are ported, and there are native ones).

> Has anyone used the 'LAN' port on the Falcon or TT to get netowking up

> MagiC).

MintNet is going to be your most flexable as far as the networking goes.
I also understand there is a version of MagiCNet that is very close to
MintNet...in that it can use alot of drivers and such.

For MintNet...you get the standard Unix things.
NFS for mounting hard drive partitions (across other machines that support NFS)
http servers like apache.
telent servers
ftp servers
etc....

Clientwise for MintNet....you get the unix standards like lynx, pine, etc...
Some Xwin 11 clients can also run under MintNet.
With a socket called GlueStik you can also run most, if not all of the
STik/STing clients/servers with MintNet.

STing is also quite good, tho' you'll have to rely on ftp for cross platform
file sharing. Between the two Atari Boxes however, there is a drive sharing
utility for STing where one can mount each machine's drive partitions to the
other's desk top. I forget what it's called (BNet I think?), but I do know it's
out there.

On the server end for STing....
There is a basic http server.
A Basic FTP server.
And a utility for mounting TOS/GEM hard drive partitions across the LAN.
AFAIK there isn't any standard file sharing protocol for STing such as NFS.

I do belive that with the STing archive, there is information on how to network
TOS/GEM machines using MIDI, Serial, LAN, and even the Printer ports. A TCP/IP
link between the machines in essence. As for clients that work via the TCP/IP
ring...there is the BNet thing I was talking about, and your usual STing clients
and servers like ftp and http.

Unless you go with an ethernet solution, the easiest way to connect two Ataris, is using the MIDI ports. The fastest way is to build a special printer cable that connects the two via parallel ports. One can also use a null modem cable. It may even be possible to turn the so called apple talk (lan port) into a null modem type connection?

Brian

Dumb questions does not exist :)

Several years ago i connect a simple DCF77 clock to the falcon joystick port, with an cpx module my falcon got time/date from the main clock in braunschweig. I do not set this clock since more as 6 years.

This chain does not save other nvram parameters.

7233. Program idea

Newsgroup: comp.sys.atari.st
Date: 2003-10-30 20:51:17 UTC
From: mail@freeman-studio.com
Message-ID: <5c1cf651.0310301251.24321223@posting.google.com>
Source record: 22814

Hello!

I am by not much of a programmer, so this might not be completely possible, but I've got an idea for a program, if anyone with programming skill would like something new to try. After reading some posts here regarding networking, and how in some cases the only networking option available would have to be through FTP, I thought the following idea would be extremely useful in that circumstance:

An FTP-based networking drive system, like BNet and NFS, except that it uses a basic FTP client as its core. It would work by the user first setting up a list of FTP sites (and pertinent FTP access info for each site) that they'd like to access through the drive system (like BNet sets up its IP's for networking). A drive is set up for file system access. Within this drive, folders for each FTP site are displayed. When accessed, files can be used just like the computer's normal drives function, except that the data is being accessed through the FTP client core. This program can be a Mint/Magic file system extension, or a TSR for Geneva and Single-TOS. It would either automatically, or through settings from the user, know which sites the user has upload priviledges for, and marks the ones the user doesn't as "Read-only". The user would be able to use the desktop for all file functions, just like they would with their hard drive.

Other more advanced items in the program might be adding an icon called "FTP setup" or "preferences" to the FTP drive window that lets you quickly add or edit sites without having to edit a file by hand, an extra program or module that automatically (either temporarily or permanently, depending on the user's preferences) adds a site on the filesystem and opens the site's directory in a window if clicked on within a web page in CAB (or other browser) as well as handling direct file downloads requested by the web browser when the link is to a file instead of a directory.

Anyway, that's the basic idea. It would be incredibly useful for things like web page design where the web page editor loads and saves the file directly to and from the FTP site, instead of storing it on the hard drive and then having to FTP the file later. It would also be good for FTP site manipulation through the desktop's built-in functions (cut, copy, paste, delete, rename, etc.), and networking with *any* TCP/IP program. One could even "unzip" a ZIP file directly from the FTP site without having to actually download the ZIP file first.

Well, if you think the idea has some value (obviously, I would find it incredibly useful), is feasible, and you have the programming skill to

do it, and would like to, please do!!! :)

Mike Freeman

Calltime3? Where might that program be found? The original Calltime was
written by one Bob Arredy, if I spelled that right, and no longer works
with changes on the far end.

I could certainly use it, and think some others might too.

Where did you get it?

Jim

The LAN port is identical to and is wired to Modem 2. The only
practical use of this port is for connecting old Macintosh modems (you
don't need an adapter) or to avoid purchasing a switch box when you
have two serial devices (of course, only one can be on at any one
time).

The existing interface (others have given you the link) works along
similar lines. From what I can tell, you would need to use a PIC to
translate between an Atari port (take your pick -- cartridge and SCSI
have been used so far) and Ethernet. Unfortunately, I don't know how
to do this, but Roger Burrows and Lyndon Amsdon are probably the ones
I'd beg for help if you attempt to do this.
>
> Is there any site that has a 'step by step' guide to getting an

These consist mostly of "plug it in, run the drivers, and hope".

> Is there a more appropriate forum for these questions?

This is the right place, but Ethernet on my Atari is on my "will do
later list".
The board at hardware.atari.org is not terribly expensive and is well
respected.

Hi all-

A related question... My Falcon's clock has run slow for many years, and seems to be getting slower all the time. I have to reset the clock every time I use it as it loses several hours per day. Is this a symptom of a low or bad battery? When I had Alex Yu (at ATY computers) do my Nemesis installation in 1997, I had him put in a new clock module or chip, but that didn't help! Maybe the clock chips he had in stock also had old batteries? Do you think my problem would be solved with a new clock battery? Maybe it has nothing to do with the clock module.

Thanks for any input on that.

What you are referring to has been done for Linux as ftpfs, so it is
indeed possible. It might be a bit tough to get anyone to port this
though, as Samba would likely be considered a better (more modern)
choice. I consider the idea to be a "nice thing" rather than a
necessity, as it's easy enough to FTP the file, modify it, and FTP it
back. Still, a transparent interface would be useful, regardless of
whether it's ftpfs or Samba.

Humm, well you covered ftpfs. The way I handle this situation is my IDE
on linux, Komodo has something called remote files via an ftp server. You
specify the address, etc and can add files from the remote site to your
project. Whenever you load or save it loads and saves to the remote ftp
site. Perhaps this would be easier to implement into qed or your html
editor of choice.

Thanks,
Mark

PS: QED is now open source so this wouldn't exactly be a tough mission to
accomplish.

This is good to hear! Has ftpfs not been ported to Mint yet? I'd love to see this ported to both Mint and Magic, using at least MintNet/MagicNet, if not Stik/Sting. While Samba is a great thing to have ported as well, something like ftpfs would be quite useful for people who can only use FTP on their network. It would save a few steps in the transfer process, and thus some time. Even for someone who doesn't have an FTP-based network, it would be great, for example, to be able to upload a file to an FTP server directly from within the program that created it, simply by saving the file. This would be much easier than to save to the hard drive, load up your FTP program, and then upload from the hard drive. I don't know. Maybe I'm just lazy :) but I like saving time and skipping extra steps whenever possible.

True, it isn't a necessity. But I'd personally consider it just one more great tool to have on our systems for times when it could come in handy.

Many thanks Derryck for that useful information. Much appreciated.
I don't really fancy trying to desolder the chip if I can help it as there
is always the possibility of causing damage to the motherboard.
I shall attempt your last option first and try to access the coin
battery inside the chip.

Cheers,

Paul.

Hi,

The software "Eureka" is updated and released on its WEB page.
It is a "2D Graph Describer and 3D Modeller". It is updated
nearly every month, if I found significant improvements for it.
You will have to fetch it at :

http://eureka.atari.org/eurka311.zip
That is the Complete Common Edition

http://eureka.atari.org/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.atari.org/eurka020.zip
Is the Complete 68020 Edition

http://eureka.atari.org/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.atari.org/lib_dgem.zip
Are Dynamic Libraries Extensions for Eureka

http://eureka.atari.org/tiny044.zip
Is the OpenGL Extension (requires previous package)

The novelties are mainly better optimizations with GCC
3.3. But Eureka is also improved with a new mathematical
library (CEPHES), that is much smaller and better.

I wish you big fun with all this new STuff !

Best regards,

-- Franï¿½ois LE COAT
Author of Eureka 2.12

Well i use great Freedom1 fileselector (note, not Freedom 2) and with Aftp u may reduce steps. Aftp window act as desktop window, so dclicking on remote xxx.txt for example, download it, and opens it in default editor via VA_Start, qed in my case.. After i edit the file i press ctrl-s (save) and then one extra step, ctrl-m (save as). At that point i dont hit OK button, but just drag filename to Aftp window. That is Freedom's strenght, apart from cool and usable interface, its drag n drop abilities are awesome...

> True, it isn't a necessity. But I'd personally consider it just one
> more great tool to have on our systems for times when it could come in

Agree! Still we do have some very nice apps we can use to our advantage and Aftp and especialy Freedom are those.. Esp since small probs F1 had with unloading dont occur anymore (also fix for that, if it happens) i really recomend it to anyone.. Also to non mtasking users, since u can open more Freedom windows and drag files, etc between them, so easy to copy etc file within apps...

Janez

Hi Rob, all Falcons have the same version of tos. You need to set the nvram
to English, you can also specify the keyboard etc. Have a look here,
http://storage.atari-source.com/atari/mirrors/ftp.lip6.fr/pub/atari/Falcon/Utilities/
and download nvram.zip. Do be careful because an incorrect setting can
bugger things up.

No worries :-)

> I don't really fancy trying to desolder the chip if I can help it as there
> is always the possibility of causing damage to the motherboard.

Since Steve Sweet hasn't come forward, the trick is to ADD some solder to the pins BEFORE removing with solder sucker or braid.

> I shall attempt your last option first and try to access the coin
> battery inside the chip.

I didn't witness the top being removed from the chip when Steve replaced the NVRAM chip, but you should be able to pry it up with care. IIRC the crystal for the clock was under there too.

The "Normal" ST monitors don't work on it, mine has an old IBM color monitor on it. I didn't get to see that guys replay, otherwise I might have been able to talk one of my Dahlia Growers up there to get it for me and ship it down. It would have replaced my dead falcon.

I run some ST programs on mine, mostly WP's and such, have never tried a game. I also run the graphic editors too. I don't have any cards or such in mine, it's a stock 4X4 with a 2giabyte scsi drive in it.

Just a thought - do you use Cubase ? If so, then I would expect the clock
to go wrong. I was told once a long time ago, that Cubase takes
precedence over the clock. Certainly I have had clock problems on an ste
running Cubase, which was fine when using other software.

Cheers

Paul

I've used Freedom 1.15 during quite some time. I found it very annoying
Freedom unloaded itself after it has been called x-times (30?).
it's not very clear to me, but are you saying you have patched Freedom
1.5?
I also has used Freedom 2.5 during a long time. I loved that FS but
as I was getting more and more trouble, especially with Calamus SL 2002
which I use very often, I abandoned it (with pain in the hart) in favour
for Boxkite.
aFTp is a great app indeed. It's a pity the development of it seems to be
halted.

Salut,

I never had problems using magxnet. However it has been a while since
I've uwed my Falcon (shame on me !!).
Check out this site, maybe you'll get some extra info :
http://users.pandora.be/saka/atari/reality/magxnet.htm

When I take a quick look to your setup I think you should add a default
route :

Jean-Luc CECCOLI wrote:
>
> And, in order to avoid useless questions, here is what I did :
>

> ifconfig en0 addr 192.64.1.2 up
> ifconfig en0 netmask 255.255.255.0
> # But... where's the route ?

route add default en0 gw 192.64.1.1 (check with your IP-network range
numbers)

> - \XTENSION
> +ENEC3.MIF
> +MAGX_SLD.OVL
> +SLIP.MIF
> +SOCKETS.DEV

Don't know what hardware card goes with the ENEC3.MIF driver
(ISA-card?).

> - D:\ETC
> +DOMAINNAME, unmodified
> +HOST.CONF, unmodified
> +HOSTNAME, containing
> TT030
> +HOSTS, containing
> 127.0.0.1 localhost loopback
> 192.64.1.2 TT030 en0

You should certainly put the other computers (PC) from your network in
this file.

```
> +NETMASKS, containing
> 192.64.1.0 255.255.255.0
^^
Try once to remove the last ".0" from your network number...

> +NETWORKS, unmodified
> +PROTOCOLS, unmodified
> +RESOLV, containing
> domain localhost
> nameserver 127.0.0.1
> +RPC, unmodified

The broadcast address is used to send messages to all hosts.
If you want the broadcast address to be 0 just type this in your
magic-console (in the right directory: D;/etc)
# ifconfig en0 down
# ifconfig en0 broadcast 192.64.1.0 up

> * route (with no parameters) returns :

Hello,

Check out the MyAtari online magazine site. In the October issue
there is an article I wrote called Broadband ST. I talk about
using the cartridge port of the ST to get access to the EtherNet.
This would also apply to the Falcon and the TT. I am using the
EtherNEC hardware device...

No. I meant that i didnt stumble on F1 to unload quite some time now. And also when it did, i only switched on NFSEL in ACC for troublesome app. Unloading at XX calls only happened to me in CAB and also in few calls it work again, odd stuff actualy...

> I also has used Freedom 2.5 during a long time. I loved that FS but

Well i did found F2 a bit clumsy. What i disliked even more is fact, that it was hardcoded to C:. Since i dont boot from C: i had troubles and really wasnt in mood to battle them, or to have F@ only on C:. Boxkite looks okay, i just find it very limited compared to Freedom...

To follow up my last question, on lauguage change, I managed to change the language to english from german, but I still have the keys in their german quertyzuiop set out. Can i easily flick the keys out without causing any damage and move them about to their new placings. Havent tried yet as I thought I'd ask before causing damage.

Thanks again all

Rob

Yes they pop off pretty easily. I use a butter knife wrapped in a cloth to help pop them off if they won't with your bare hands. Start from the edge and work your way in.

7268. Problems with SCSI HDD (help me!)

Newsgroup: comp.sys.atari.st
Date: 2003-11-01 19:54:57 UTC
From: hearena@advancedsl.com.ar
Message-ID: <a347a87b.0311011154.7c71e299@posting.google.com>
Source record: 22900

Hi All,

I'm trying to install a 4gb SCSI hdd to my 1040STfm using The Link 2.
It does recognizes it... I format, then make the partitions,
everythings allright. But when I wanted to make it "booteable" using
the hdutils.prg I get a "verification failed" error (the disk is new
without bad sectors).

So, I try with HDDRIVER 7.7... format, partition, I make it
bootable... everything alright. But whatever I put on the AUTO folder
of C fails to load... sometimes I get 3 bombs, some time more bombs...
some times the computer just restarts.....

I tried copying a program to the C drive or the D drive and sometimes
they work... and sometimes don't.....

Am I missing something? Tos is 1.02...

something is wrong, LED's last a very long time.

Measure the voltage at the connector and make sure its not something silly
like 12v comming out of it.

There are 3 pins at J102. I plugged the LED into the last two pins and it
did nothing, so I plugged it into the bottom 2 and the LED flashed and went
out. This is the stock LED. I will get a volt meter and test the pins.
What should they be?

Gaining access to the keys and the rubber doobries that do the switching is obvious (unscrew all the screws on the back of the keyboard), I guess that the individual keys can be moved around to suit.

Take note that one key has positions for two of those doobries but only one is actually filled.

Well u can also use Smurf, which also cant save Jpeg i think, but with
Apex comes nice tga<>jpg cpx, so u can use that. U can alsu use Photoline,
photoshop like app...

Hi Rob!

I am not 100% sure, but I think *all* Falcons had universal TOSs which could be selected from the NVRAM, using NVCONFIG.CPX. This is a 4-part CPX, though this isn't immediately clear. Just click on the right-facing arrow at bottom right to bring up the Keyboard panel. It offers 17 - count them, 17! - keyboard layouts (besides the main European ones also Turkish and Saudi!!!) and 5 languages, which should be enough for almost anyone!

Regards, /Peter/

Yeah. Strange ain't it, especially since 90% of the Atari software
companies are either out of business or no longer support or sell Atari
software.

Pirate copies of ANY Mac or PC software are on the internet the instant
it is released, and often even before it is officially released.

There is some EBay activity in Atari apps but not much. Probably are
some demo versions of apps on the CD compilations that are being sold
now.

I never got Freedom working on my system (Falcon030/CT2b, MiNT 1.16a,
XaAES 0.970) so I don't use it. I had more luck with Boxkite, but
nowadays I only use the limited built-in fileselector (TOS or XaAES).

Or use any editing app you like and then convert to jpg with the now free
CharlyImage from Wilhelm Mikroelektronik GmbH. It's a free download from
there website but some basic understanding of German is needed as it
never got translated to English afaik.

I guess because more people wanted to download games, and the cracking teams wanted a wide audience. Also, all the crackers distributed games on Menu Disks, incorporating graphical and audio demos that were often superior technically to the pirated software itself - I would hypothesise that this is why mostly games were cracked (and I don't know if commercial software had copy protection, so there was nothing to crack..), mainly for the prestige and ego trip of both coding better software than the commercial developers, and beating the copy protection they "challenged" the crackers with.

Ironic that, had the crackers used their superior programming skills (they could often halve the number of disks needed by original games with cracked and compressed versions, and outsmarted all the copy protection systems. I even heard tales of a couple of games being enhanced by the crackers), they could possibly have prolonged the life of the platform by years through producing better (and so more popular) software, instead of burying it by destroying publisher's profits. It really was ridiculous - games were being cracked and uploaded on the same day as their release, in some cases. Can anyone blame developers for abandoning the platform?

Still, this is a double edged sword. There are vast collections of ST games online, composed entirely of menu disks. If there hadn't been wholesale cracking of practically every title ever released, we would now have enormous difficulty in locating copies of all the old classics, long after they went out of print.

Tom

Perhaps some archivist somewhere should form a "decracking" team, to extract programs from the menus and put them in a library somewhere, in their original form...

Yeah!

My other atari hobby is the 8bit serie. Those little atari's are very powerful and not very hard to program. But for those computers almost every program ever written is available on the internet. Not only games...

I woul love to see other (discontinued) software available too. I would even pay for it, if the provider of the software would like. But now it's almost impossible to get something.

Greetz,
Marius

This was a very good thinking of you! And I think you are completely right.

Are there still any falcon/atari ST game programmers active? On atari 8bit there are still new productions written. Even very nice ones!

Marius

Easily, but there's one problem: The keys with numbers and signs are
different on a German keyboard (different combinations for shift and
normal). So to get a complete American or British keyboard, you'll need
replacement keys for 0-9, and [];',./ etc.

Maurits.

Sounds like your talking about removing the keys physically here
(unless I am reading it wrongly) which would be pointless of course.
You can purchase tools for removing the caps quite cheaply, they
basically resemble two wire rectangles mounted in a handle at one end.
If you get one of these then you can simply remove the caps switch
them around as necessary without having to take the thing appart.

Stephen Moss

The source code is (and always was) available!

Just use a disassembler like Easyrider or TT digger in the executable, and
then you have the source code!

What? You need comments as well? That's something for you then ;)

On a more serious note, I doubt that we'd understand Paul Woakes sources,
judging from the speed his games run (the code would be very messy :)

Hi all,

I've just updated the MagiCMac 6.20 front-end (some text edits, package is now a Stuffit archive.

I've also added a patcher for the OS file which will replace (most of) the German text.

URL in sig, as always.

I agree too. Altough i must say that with all due respect to crackers knowledge, it still take VERY diferent skills to crack, than create a game. It is "easier" to track already written software in monitor, or check for certain patterns in dissassembled source etc.. Of course, to avoid all sort of protections and seek them when encounter them 1st time require a lot of knowledge ...

> Are there still any falcon/atari ST game programmers active?

We are alive, we are :))

> On atari 8bit there are still new productions written. Even very nice
> ones!

So are on Falcon/ST. Not a lot new apps, but a lot of them are preety good. Many new great games this year from Reservoir gods, all great games etc...

I got an Atari in '86 (though I defected to Amiga shortly after..) and for
years it was mostly chiptunes.

The first game I got that used samples was the title music in 'Starglider'..
That was a full 20seconds or so of music, initially sampled on an Ensoniq
Mirage synth, then 'ported' to the ST.. that blew me away at the
time...(christmas '86)

It used some processing time so it was a while before samples were used for
FX on the st...

Hi,

I decided to update POV 3.1g on my WEB page.
I also decided to stop the release of MegaPOV.

In one hand, POV 3.1g is improved by GCC 3.3, that
allows an increase of the speed, and the compacity
of the program. In the other hand, POV takes advantages
of a new mathematical library (CEPHES) that is much more
compact. With those elements, the new build of POV must
be much more efficient. The 3.1g version of POV is also
handled the best by EB MODEL 3 of Emmanuel Baranger.

Concerning MegaPOV 0.7, it has no reason to be published
anymore, specially since the work of Patrice Mandin on
POV 3.5.

I suggest you to fetch POV 3.1g on my homepage, and to
tell me about it's efficiency, that I wish to be better.
You're welcome ...

I wish you big fun with all this new STuff.

Regards,

Hi folks.

On Sat, 01 Nov 2003 Derryck Croker wrote :-

>Since Steve Sweet hasn't come forward, the trick is to ADD some solder to
<the pins BEFORE removing with solder sucker or braid...//

Hi Derryck,

Thanks for your reply. Actually I did know about that trick from
long ago,but I was more concerned about the possibility that the
Falcon motherboard had it's components crimped and soldered into the
PCB as have some computer boards that I have been working on. Devils
to get anything out of them intact even a simple resistor !

>I didn't witness the top being removed from the chip when Steve replaced
>the NVRAM chip, but you should be able to pry it up with care. IIRC the
>crystal for the clock was under there too...//

Thanks for the warning that the crystal was under there as well. I had a
session tonight with a sharp knife, and it is possible to cut the top
off the MCCS146818BM very easily indeed to reveal a rubber-like filling.
This I picked away with tweezers until I revealed the 3 volt lithium
battery.It turned out to be a very easy operation indeed which did not even
involve having to remove the chip from the circuit board.The crystal
is situated at the left hand end of the chip, so if anyone else wants
to try this, then start the left hand cut 7mm away from the end of the
chip to avoid the possibility of damaging the crystal and it's connections.

My MCCS146818BM clock chip is now powered from a lithium CR2032 battery
situated in a coin cell holder which I have glued to the motherboard.

All now working just fine. Clock back on line ! Thanks for all of your
feedback.

Just after I had completed the task, I received an e-mail from Dial
Electronics Ltd. I had tried to access their site previously to see if
they stocked the MCCS146818BM.

It appears that they do stock it !

Check out www.dialelec.com

7307. Unidentified Stienberg Grey Box....

Newsgroup: comp.sys.atari.st
Date: 2003-11-04 02:27:35 UTC
From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <57Epb.31317$SV2.14875@bignews3.bellsouth.net>
Source record: 22938

I found a bundle of CuBase stuff for the Atari Falcon and have identified all but one piece.
In the box of goodies...a Falcon FDI, Analog 8, a couple CAC clocks and CAF dongles, but there's one oddball piece of equipment I've yet to see before.

It is a nicely molded grey plastic MIDI interface that fits via cable to the printer port and provides 3 outputs and 1 input. The molded chassis has Steinberg stamped in it and a place for a 9v power supply to plug in.

What is this thing called? What drivers go with it? If there should be a disk with it containing drivers not in the general MROS releases...I'd sure like to get a copy.

I've already got an SMP24 taking up the Falcon's printer port...but it'd sure be nice if whatever this box is will work on an ST.

Thanks,
Brian

Nice one, Tim. Especially with the 1280*960 mono monitor - rare to find, so look after it.

(Tim) wrote:
> Now I need the original Software, know where I can download it?
Eh? It probably came with as much original software as the ST - ie none apart from control panel extensions!

> Also what programs work on the TT. Do ST programs run?
Most GEM programs will run as long as they support Mono with the monitor you have. There are several TT specific utilities for changing the headers of programs to run in TTRAM you may want to try. Take a look at Martin's ftp site ftp://chapelie.rma.ac.be/atari/ or Jo Vandeweghe's web site for pointers; http://www.ping.be/~pin10575/ATARI-E.HTM

> I also need to know if I can hook up a SC1224 or SC1235 to it. It came
> with a 19" Mono monitor.
Neither, but the good news is that you can plug in a VGA monitor directly to get all three ST resolutions plus the two lower res TT resolutions. The highest res TT mono resolution comes through the one you've got only.

> Thanks
> Tim

Btw, it may be worth looking for the TT-specific version of Llamatron - extra samples which are... interesting!

regards
Harry

Source record: 22848

I recently got one of these, but no manual or disk(s) came with it.
What I'd like to know is more precisely what it can do.

As I look about for A/D converters, recorders, etc...I notice that they all have
different sample rates, frequencies, and sync rates, etc...

What all will this thing support in combination with CAF?
I.E. Will a box like the 'Fostex VC8 8ch A/D-D/A Converter' work with this?
http://www.fostex.co.jp/int/pdf/AC2496_VC8.pdf

Am I locked into DAT, or will other devices work?

Any place online I can see the specs for the Falcon FDI?

Thanks,
Brian

> adaptors?

Yes...I got my Dynalink adaptor from Roger himself at Anodyne, as he had a few in stock.
I've used it with my Falcon CT2B. It's not perfect, but yes, it does work, albeit you're limited to STing and possibly STik...unless someone has gotten around to doing mintnet drivers for the thing since I last hunted. I found this solution to be quite good and reliable for running clients. When running server software it gets a little iffy. I'm not sure if the server problems I had are specific to the Falcon with a CT2B...it just might work fine on other machines with a good SCSI host like the Link 96/97/ICD2, etc.

I also got an EtherNEC kit that plugs into the ROM/Cartridge port, and have used it successfully with both my Falcon and my MegaST. It has alot of drivers avilable for it for the various machines, OSes, and TCP/IP stacks out there. There is also a product similar to the EtherNEC, EtherNEA, but it plugs into the ASCI port instead of the ROM port.
http://home.arcor.de/thomas.redelberger/prj/atari/etherne/index.htm

There is also a kit someone did a while back that uses one of the parallel port adapators, lots of wires to various ports, and a hudge brick of an adapator. It's a pretty messy solution however.

Brian

> As I look about for A/D converters, recorders, etc...I notice that they all have
> different sample rates, frequencies, and sync rates, etc...

> What all will this thing support in combination with CAF?

I beleive the FDI is a SP/DIF type interface. If you need a D/A, get
one with an SP/DIF interface, or get a dedicated D/A with the falcon
DSP port interface. They are cheap second hand.

I think the FDI supports 44.1 and 48khz samplerate. Samplerates and
digital interfaces is a mess; some interfaces must run as masters,
i.e. using their own clock, some has inputs/outputs for word clock
etc. Word clock is used to synchronize digital interface clocks. I
don't know if the FDI supports this feature. (Word clock uses a BNC
type connector)

> I.E. Will a box like the 'Fostex VC8 8ch A/D-D/A Converter' work with this?
> http://www.fostex.co.jp/int/pdf/AC2496_VC8.pdf

The Fostex VC8 has an ADAT-lightpipe type digital interface and can
not be connected directly to the FDI. However, I think there is an
ADAT expansion for the falcon too..

> Am I locked into DAT, or will other devices work?

Anything with a SP/DIF interface, as long as it supports the same
frequency..

Hi Kees,

>>> sombody knows how the TW project is going?
>>> Translations and other good news about it?
>>
>>Translation into English continues. It's a big job as you can appreciate.
>>
>
>The german edition will do. Any opinions?

Why don't you download it from http://www.tempus-word.de , install it and
form an opinion yourself?
The English translation is moving slowly but steadily in the right direction,
Tempus Word NG will definitely be available in English, have some patience,
the translation of such a project doesn't happen overnight...

PS: Kees, I need to get in touch with you....
Mail me at dennis.vermeire@tiscali.be, the GMX account will filter away all
your mails...

Cheers from Belgium
Dennis

Brian,

I hope you aren't talking about my attempt at creating a parallel port
adapter for the genius lan series. That was a prototype and a pathetic
one at that. The actual genius adapter by Elmar Hilgarte was a nifty
solution though seemingly a tiny bit more problematic than the IMHO
optimal ethernec solution. The ethernec worked without issue on my CT60.
That IMHO is the truest test ;-)

I have a MegaSTe KB, that is hooked up to my TT030 right as we speak, that I am selling. The only problem is that two keys do not work. F3 and Right Shift. A new Mylar can solve this problem, or maybe checking traces on mylar. I think a new mylar is $30. Are you interested?

Hi all,

I've just got my CT60 and having problems with the floppy drive when copying to my internal IDE drive. In F30 mode everything works fine though in CT60 mode I get a load of address register listings and machine locks up.

I also have a problem with the CT60 control panel that when I click on it a temp reading comes up and then its back to the rows of address listings.

I have managed to run bob tracker a couple of times, though some of the mods locked up before CT60 so at least that work ;-)

I also can't run Zbench , it wants 640x480, Does not work in ST high, I only have a Tv so many I can't use this program ?

TIA,
Chris

It looks like you don not have recent ABE/SDR/TOS. You can flash TOS without problems, but for ABE/SDR you will need JTAG cable.

I recently dusted off an Atari TT I had sitting in the closet and it still boots fine (should I have expected anything else? :). I'd like to install Linux on it and add it to my home network. But first I need to replace the small internal hard drive. It's been a long while since I've been active in the Atari computer arena. Can someone give me pointers and recommendations as to what type of drive to replace the internal hard drive with? It's a SCSI drive, right?

Thanks for any help.

Yep, a SCSI. A 2 gig SCSI is pretty common for a lot of TT users I've noticed, though naturally larger ones can be used.

How can you tell what ABE/SDR you have? The TOS version appears at
bootup, but the others do not appear to.

Galen (who is having similar problems)

Message-ID: <3fa9f23c$0$3344$cc9e4d1f@news.dial.pipex.com>
Source record: 22870

I followed the insctructions, all seem simple. Though my DIMM is PC133 it is CL3 and it seems it may not work. It does seem to run for a short while though its not long before it locks up, I dont know if its the programs I am using or what. I did try to boot STOS and it came up illigal insctruction which could be anything. I didnt upgrade the falcon bus, it is still 16mhz.

At first CT60 wouldn't boot to desktop at all. I traced this down to general.cpx which I think there was a update for it. There maybe other CPX's causing problems also. I wouldn't have thought a simple CPX would casuse any problems which makes me think my DIMM does not work correctly....maybe.....

I do have problems with the floppy drive each time I access it. I doubt all these faults can be anything else but memory problems? unless CT60 just does not like the stuff I run ?.

Thanks,
Chris

Please reply to yvesrogne@free.fr

Hades help please (continued)

After getting helpfull advices I managed to do the tiny solderings ang got the
computer fully working ... always during a random time from 10s to 5 minutes.
It seems a soldering or a trace is half brocken somewhere.

I always end that way :
exception : spurious interrupt
pc=7fe58b86 sr=2100 usp=88040053 formatword 060 pc-4=46fc2100 3f3c0002
d0-d7=0000ffff 00000000 00000000 0000ffff ffffffff 00000000 00000000 00000000
a0-a7=7fe58ca5 000003cc 7fe371c6 7fe58a8a 00005758 7fe58b86 00005750 forgoten
stack=21007fe5 8b860060 00000000 7a0b0000 00000000 00000000 00000000 00000000

Can anyone tell me what is in rom at adress 7fe58b86 ?

I also noted thatif I let the auto folder to start I get that crash during
HSmodem installation ; drvin.prg is ok but escc.prg now crash after the display.

Please reply to yvesrogne@free.fr

Do you have the specifications for this magnum memory board? does it use
standard EDO 60ns 72pin simms or some impossible to find variant ?

I don't have much experience with SCSI HDs. Do I need to concern myself
with the type of SCSI or will any SCSI HD do?

A bit down on my list has been networking my Falcons with my PC after I finish recasing my Falcon in a Wizztronics case and installing my CT60 on top of my Nemesis Falcon. (My other currently running Falcon is a CT2B.) If I understand things correctly, the SCSI option with drivers from Anodyne will be limited to sting, which I used successfully with dial up. It would be a bit cheaper, depending on how much I'd get a SCSIlink for. That had been my first choice, since I didn't know how accessable my rom port was going to be after recasing. Not an issue now with my Wizztronics case, since I have the rom port extender and a cartmaster lite, allowing 2 carts. Now, I have 2 dongles, Steinburg and Soundpool, but I won't mind shutting down and rebooting when I want to switch. Now I'm curious if there is any performance difference between the rom port and scsi options? I've not yet gotten into mint, so that may be a consideration later. I've used MagiC for years. Anyone got and wisdom regarding general speed between the two? (Web browsing, file transfers, ect.?)

Wayne

You want 50 pin internal ribbon cable. Lots of newer scsi's are wide or small connector. You don't want that. You want the old style 50 pin. You need to make sure it's not differential or LVD (probably a scsi drive with a 50 pin internal ribbon connector won't be). Then I'm pretty sure TT can't accept parity but maybe it can. Plug it in and go ;-)

PS: Some of these newer drives that are wide or ultra scsi work just fine with the right adapters though it's a waste of your money since the TT can't make use of the better scsi speeds.

I like Freedom 1.15 but there is a very annoying thing with it. If it's
called a x-time (30?) it gets unloaded.
I've used Freedom 2.5 during a long periode. Until recently I never
encountered a problem with it, at least not that I recognised as caused by
Freedom. The problem started with the arrival of Calamus SL 2002 which
didn't like Freedom 2.5 very much. That's the only reason why I dumped
Freedom 2.5 in favour for Boxkite.
AFAIK, Freedom is the only alternative to boxkite.
CU,
Martin

It is possible ! CL3 is not acvcepted by the SDR controlle !
SDR controller is attempting DATA for 2 clock period (CL2 !) . Some CL3 will
output data before the THIRD cycle, but it is not an obligation !
The only good way is to use a CL2 DIMM !

It does seem to run for a short while
> though its not long before it locks up, I dont know if its the programs I
am
> using or what. I did try to boot STOS and it came up illigal insctruction

16mhz.

With DIMM not good all is possible in the TOS ! The TOS is running in the
DIMM !

correctly....maybe.....

Change the DIMM and try booting with the minimum things in auto & CPX.
Use Xcontrol and CPX from CT60 software pack SURE !

> I do have problems with the floppy drive each time I access it. I doubt
all
> these faults can be anything else but memory problems?

It is stupid to try to find some explanations when we have a DIMM
problem....
Solve the problems step by step... from the bigger to the smaller .

Well after getting a deal I couldn't pass up: A TT030 system for $50. I thought about refurbishing it as the case was very well used and discolored, and missing screws. The KB also had 2 dead keys. I picked up a NEW TT030 Case top and NEW Keyboard from Best! Now my TT030 looks BRAND NEW! I have always wanted one of these babies and I would of spent hundreds of $$ on eBay for something like this, and not as good too!

Now round two. I ordered a Magnum PS/2 Memory board from Germany. It holds two 72-pin SIMMs for up to 256MB! This should be interesting. I have a 500MB HD so that should be ok for now. Also got a 2Gb External HD hooked up.

What I want to do now is load up a different OS. I am new to the modern STs, so I would like some help on getting Mint or others OS's loaded. Is there a clear step by step guide out there? I tried last night to load Freemint and I couldn't get it working. What about Linux/Unix? Whats the best option for that?

My next challenge will be getting this on my home LAN! Right now I have an Amiga 3000 and 4000 and my Windows XP box, all on broadband! Gasp ;)

Tim

If you have the latest version of ABE check your hardware, or else
remove the "scsi processor device" inside HD Driver.

> I also have a problem with the CT60 control panel that when I click on it a
> temp reading comes up and then its back to the rows of address listings.

> I have managed to run bob tracker a couple of times, though some of the mods
> locked up before CT60 so at least that work ;-)

Bob Tracker works fine but maybe you have problems with DSP clock
(noise). Try to 32 MHz. or else like the 1st pb maybe you have pb with
access to the motherboard. Clock patches are removed ?
You can also try to boot without SDRAM if the 2 shifts are pressed.

> I also can't run Zbench , it wants 640x480, Does not work in ST high, I only
> have a Tv so many I can't use this program ?

Set the Overcan bit inside the CPX.

Regards,

Didier.

AT first I couldnt get the desktop up, so I removed AUTO and CPX totally and I got desktop. I then removed all ACC also, and tried putting them back one by one, when a CPX seemed to crash I didnt use it for a while, then when the system booted I tried them all back again, but ones which seemed to cause the fault worked the second time. I think this is a ram problem for sure since everything is very random in faults.

Thanks,
chris

I believe it uses FPM 60ns SIMMs up to 128MB in size for a total of 256MB.
I think the brand is Magnum or AixTT. They both made a TT RAM board that
accepted two 72-pin SIMMs. Some claimed success with EDO but better be safe
and use FPM.

I use HDDriver 7.93 on the Falcon (For CuBase Audio).
I use HDDriver 8 on the ST (With a megafile 60).
Yes, I do lisence 2 copies with seperate serial numbers...one for each machine

Note, I've not tried a Dynalink on my Mega yet...waiting on a Link 97 adaptor.

>
> Has Atari mastered a DHCP connection yet?

That's a good question. STing does not, and I'm not sure about MintNet and the
others. My personal network is on a Draytek NAT router that does support DHCP,
however, I don't use DHCP, even on my Windows box, for a number of reasons.

With alot of modern routers, and the correct mask, you can put just about any ip
address in STing, and as long as it's not already been assigned to some machine
it'll start working. I've had some success with this in various workplace
ethernet LANs; altho, the proper thing to do is call the sysop and have them
assign a static one to you.

Why I don't use DHCP on my home LAN:
1. I want all the ip addresses on all my machines to remain the same at all
times. I know without doubt that my PC is 192.168.1.10, Faclon is 192.168.1.9,
ST is 192.168.1.8, and so on. This remains constant, which is a good
thing...keeps things simple. Using the dynamicly assigned DHCP options, it's
possible for machines to get a different IP address every time you boot up.
Some routers allow you to refer to computers 'by name' rather than ip address,
but there are lots of networking softwares that would much rather you use the
numbers, or insist upon it. Many routers will also allow you to 'lock in'
specific computers (by name) to certian IP addresses even with DHCP
active...but with Ataris, Amigas, and other things on the LAN, I find it's best
just to disable DHCP and set things up manually and in a static nature.

2. I'm pretty sure STing does NOT support DHCP. It has some sort of IP
negoitation in the external dialer for PPP dial in access (not sure if this is
DHCP or something else); however, this doesn't extend into the various drivers
like ethernet, serial to serial, LPT, midi, and so on.

3. On the MintNet side of things....chances are good that DHCP support is
around and working by now...as FreeMint is moving right along rather nicely in

terms of unix compatability. I can't say for certian, as I've never tried to find it and set it up....it's too simple just to configure it once for my small and simple LAN and be done with it, occasionally making changes if and as needed. For convienience sake...I set up a an entry called guest, for such occasions as a friend dropping by with a laptop and wanting on the lan. I hand them a note card that tells them what IP and computer name they should use if they want proper access to any of my machines ;)

I use the good old TOS 3.06 that came in my TT and Neodesk for the desktop itself. This machine used to run the Black Hole BBS over in Hawaii, on 24hrs a day and at the time I had the 2ga inside (still there) an ICD Host pluged into the Atari HD port on the backside with another 550meg HD pluged into it and a 14.4kb modem.

I've wondered if the programable port could be used with a 56kb modem, but not sure the BBS software would see it.

Galen,

I'll mail you mine for postage and return postage but you have to promise
to give me the $40? USD that I paid for it.

You're going to have to mod your CT60 if you want to update it while it's
sitting in the falcon.. I did it. I have one of ajje's JTAG cables which
are excellent and cost less than $40 I believe. A wise investment
considering once you perform the update another one probably will get
released ;-)

> (used on a Falcon).

John,
No problem....
Any drive that meets the IDE or EIDE specs can be put inside the Falcon.
To make things easier on you...I'd suggest replacing the drive with one of the same physical deminsions. Falcons were built to accept a 2.5" notebook type hard drive, and later some 3rd party companies sold kits to mount and properly cable the larger foot print 3.5" drives. It sounds to me like someone has indeed upgraded this Falcon HD before, as they shipped with an 85meg 2.5" Conner drive. So.....
If you don't know what's in there...open the bird up and see for yourself, or get the drive's model number at boot time and search down a spec sheet on the web. To make it easy on yourself, order a replacement of the same physical deminsions...hence you won't have to find and change out mounting brackets and cables etc. These days, when it comes to IDE drives, there's not a whole lot of difference in price/performance between the 2.5" notebook drives and the 3.5" desk top drives. Not long ago I put a brand new 20gig IBM notebook drive in my Falcon, and it was well under $100!

You can also use external SCSI drives. Any drive that meets SCSI I or SCSI II standards should work fine. Note that most SCSI III drives and above are usually backwards compatable to the older SCSI I and II standards...it can just get kind of tricky configuring them properly. For the least hassle in addition of a SCSI drive, it's best to go with a 50 pin inline SCSI I or II device. While the wide and ultra wide SCSI units will work with adaptor plugs and whatnot...it can indeed become confusing over which adaptor will best serve your needs...I.E. some will come passive terminated on some lines, some unterminated, and so on...and which one you need can depend on all sorts of factors around how many, the order, and what type SCSI units are daisy chained together.

Finally...keep in mind that there are limits to partition sizes, and the number of partitions that TOS/GEM can see at a time...so a drive over 10 gig is going to get interesting to work with. TOS/GEM, out of the Box in a Falcon limits you to a maximum of 1gig BGM partitions. It also has a limited number of drive letters that can be assigned (I forget how many) at one time. Yes, you should be able to use every last byte of very large drives with HDDriver 8....but, when

you run out of logical drive letters to assign to TOS/GEM...a hudge chunk of your drive will be invisible at any given boot-up. To get at those distant partitions, you'll have to change the partition order, or termporarily disable partitions with your HD Driver software as chosen at boot time. Or....use something Like Mint with a unix style file system to make a few really hudge partitions.

With that in mind...a drive over 10gig can be a bit overkill for a Falcon...but at the same time...a 20gig drive often cost less than $5 or $10 more that a 5 or 10gig unit. Go as big as you want...just don't panic or freak out when you have to be a little creative to figure out how to access the whole thing :)

Hi Rodolphe ,

I have fitted a Curcial PC133 CL2 DIMM and still have the same problems ?

I tried booting by holding down Control so only HD driver loads and when I
acess the floppy the Falcon locks up after a couple of seconds.

It *may* be the PSU I am using, maybe the micro ATX PSU is not stable enough
for CT60, I will try a new PSU .

Chris

Is this related to use of MiNT, as I don't recall this happening under MagiC. Just in case this puts anyone off using this fine fileselector :-)

I haven't installed Freedom 2.15, but 1.5 offers the normal FS on an individual named program basis.

Calamus also gives you the choice of using its own FS (recommended).

Yes I know and that's what I'm using on my Atari machines but even then
Freedom 2.5 gives troubles. I guess Liberty is interfering with Calamus.

TTFN,
Martin

Hallo Brian!

BR>For the least hassle in addition of a SCSI drive, it's best to go with
BR>a 50 pin inline SCSI I or II device.

If you've got problems with IDE (defective like mine, or fully populated with CD-ROM and ATAPI-ZIP, or whatever), it's also possible to use IDE drives on the SCSI-Bus, employing a suitable adaptor. The same applies for need of large capacity, which is rather expensive (and loud and hot) with SCSI.

As of today, I've done so with my Falcon, and it worked right out of the box. ACARD SCSIDE Bridge AEC-7720U (www.acard.com) and a stock WD Caviar 40GB IDE drive. Connect, set SCSI-ID, power up, partition, and ready. But you've got to use F32 or Ext2FS Partitions in order to use the entire capacity of such big hard discs, and HDDRIVER's hddrutil program to partition, as at least the latest SCSITOOLS weren't aware of such big drives :-)

well, I have 2 birds (both with no IDE drive). One is working and one is
in a coma! The working one has no power ps plug for an IDE. The one in a
coma has an IDE power plug but I'm concerned using that one in the good
bird in case it's causing problems. So I'm opting to go with a new SCSI.

>You can also use external SCSI drives. Any drive that meets SCSI I or SCSI II

Hi derryck,
no. I was saying that the Falcon that works has a power supply with no
IDE power plug. The Falcon that doesn't work has a power supply with an
IDE power plug (I'm assuming that's what it's for). Neither Falcons have an
IDE drive!

>Are you trying to fit a 3.5" drive?
>

no, I'd like to replace the external SCSI Seagate 1 gig (swap it out
with a higher byte drive) and hopefully use the existing external power
supply to the 1 gig.

>I'd try the lead you have from the dead Falcon if I was in your shoes!
>

I considered that but since there's problems with the bad Falcon I
don't know how good it's power supply is (could even be causing problems)!
I haven't bought an IDE nor an SCSI yet until I'm confident I'm doing the
right thing :)

Source record: 22722

John,
the IDE ribbon cable that is inside the Falcon is a
44 pin NOTEBOOK style. POWER is supplied down one of
those pins along with a ground wire as well. So that
ribbon cable houses power for a NOTEBOOK hard drive.
This however will not work on a 3.5 inch hard drive
that are much cheaper and larger in data size compared
to notebook hard drives of the same cost. What I
would suggest is a small adapter from Best Electronics
that allow 2 3.5 in hard drives or any combination of
2.5 and 3.5 inch hard drives. JDR has a adapter as
well that will take the 44 pins on your Falcon MOBO to
a 40 pin IDE and give you the 2 power wires (RED and
BLACK wire each) from that 44 pin if you wish to use
it right from the Falcon MOBO. If you need more
information just contact me via e-mail and I will dig
up my old reciepts. It is very likely that one of
those falcons IDE chain works just fine. I have never
heard of a falcon blowing the IDE chain but still be
able to use scsi devices. The other alternative is
that IDE to SCSI adapter that a previous poster
showed. I had never heard of such an adapter. Nice
to see that some people are willing to try anything to
get more devices attached to there computers.

Thanks,
Carey Christenson

I was under the impression that all Falcons supplied power to
their internal 2.5 inch drive via the ribbon casble that also
carries the data. That should be present (or at least the
socket/solder pads for it) even if no drive is fitted. The Falcon
with an IDE power plug may have been modified by someone to accept
a 3.5 inch drive. In theory this could be powered via the existing
ribbon cable too, but the adaptor I bought for mine, at least,
didn't have the power connections looped through. I just soldered 4
wires to the output of my power supply and it coped well with a
6.4 GB IBM drive.

Try putting a meter on the power supply to check what the voltages
are - they should be very close to +12 and +5 V and not vary with
time or during use.

Regards, /Peter/

I believe you are thinking of the PC1, PC2, PC3, and the Atari ABC 386SX
(page 82 Best catalog). Not including of course the Atari Portfolio, and the
ST's with the PC boards in them. :)

In truth, the Atari ST and Amigas are great machines. I have both, like
many. But I will have to say, the Amiga (for obvious reasons) feels more like
an Atari 800, and a ST (for obvious reasons) feels more like a C-64.

And I am more partial to the Atari 800... so there you go. :)

Notebook type 2.5" EIDE drives get their power from the adaptor over the ribbon cable. The Falcon has a place to plug in this type of drive inside, and to the left of the Floppy drive. If you'd like to go with 3.5" desktop type drives, then yes, you'll need a standard HD power lead. Wizztronics makes a little adaptor board that sets in the Falcon and gives you both type connections for standard IDE cables (http://www.wizztronics.com). In either case, you'll need the appropriate internal mounting bracket.

> so are you saying that a new 50 pin SCSI drive will directly replace
> an external drive (re: external Toad shoebox type....ps/fan/CDROM/SCSI)
> without having to use adaptor for the original power supply, etc., in the
> box?

Yes, but you DO NOT need any SCSI host as there is one built in the Falcon. The Hard Disk port on the back is a standard 50pin MiniCentronics SCSI II type connection. All you need is an enclosure with proper SCSI cableing and a power supply. The last device on the chain should be terminated.

If you don't plan to use CuBase Audio Falcon....I really do recommend an internal IDE drive.
CuBase Audio is the only program I'm aware of that insists upon using a SCSI drive. CuBase also does a lot of ugly tricks to make the most of the Falcon's SCSI bus bandwidth. This can require a hardware patch to your falcon to fix bus errors or extranious noise when doing D2D recording. Not long after the Falcon's birth...Atari themselves, or most dealers started doing the patch before giving the birds a new home; however, there are quite a few Falcons out there that have never had this patch done.

For external use, external SCSI Zip and Jaz drives are inexpensive and really convienent, and will be a plug and play option as it already has an enclosure around it. One neat thing about HD-Driver 8 is that with Zip drives, and similar media, one can make a disk that is compatable with both the Falcon and DOS/Windows machines. These Zip type drives usually come with a 25pin D cable, so you'll need to replace that cable with one that goes SCSI II mini (50pin Mini Centronics) to 25pin D if you go that route. Alot of external enclosures have the larger SCSI 5 pin Centronics connector as well. Again, this is no problem, as the external adaptors or cables come in just about every combination of ends imaginable.

Brian

Well I don't know about the others, but after the fall of Atari Jeff
Minter started programming for the Nuon but I can't remember what the
company was called. When that all collapsed he appently became fed up
of developing for small niche systems and moved over to programming
for the PC and PDA.
He was ment to visit the JagFest UK earlier this year but did not make
it for some reason you can probably find out more at his web site...

I don't know *where* he is, but not all too long ago (I believe last year), he unexpectidly joined a discussion on the MiNT mailing list. He was quite surprised to find that MiNT was still developed so seriously and had already grown into a pretty complete *nix distribution, which wasn't really to be expected while MiNT was owned by Atari.

> 2. Jeff Minter

He's pretty active in the gamescene (although not Atari games obviously). :) He visited one of the recent dataparties (I forgot whether it was IMP or NAS), so you could actually have met him :) (And so could I, if I didn't have other stuff interfering with me going).

Maurits.

Get the Falcon ribbon cable and the cradle, and stick a 2.5" notebook drive in. Make sure you've correctly identified pin 1 on both cable, MB and drive.

That's it!

>> I'd try the lead you have from the dead Falcon if I was in your shoes!

I've changed my mind in the light of your description.

The official Falcon should have a ribbon cable plugged into the MB and a cradle for the drive, nothing attached to the PSU.

If your Falcon didn't have a drive installed from the factory then you will have to get that stuff secondhand or maybe from Best.

7399. ET6100 on Hades

Newsgroup: comp.sys.atari.st
Date: 2003-11-10 18:14:38 UTC
From: Olivier VANONI <ovanoni@icor.fr>
Message-ID: <WS3.9b9c3e38.b3a62a61.ovanoni@icor.fr>
Source record: 22730

Hi Everybody.
I found a ET6100 vdo card on a PC before to through the PC to
the recycle bin, even if I'm not sure a PC can be recycled.
Anyway, the Hades boots fine until Jinnee is up. Then the screen
is like seen with a magnifier on one eye and a binocular on the
other one. After the mouse pointer, the pixels are puzzled.
I saw that NetBsd if compatible with a Hades and a ET6100.
So what do you know about the ET6100 and the Hades ? Is it
really compatible, do I need something like an updated driver
to use it. And is it really interesting to use it ?
Best regards.

Probably because there are not too many Atari dealers around that
sell Atari software. There are some on the Internet though.

7403. CT060 and Magic and BUS Boost

Newsgroup: comp.sys.atari.st
Date: 2003-11-10 21:07:03 UTC
From: RSE <stuff@recycledTAKECAPSOUTsteel.co.uk>
Message-ID: <booujd$p7n$1$8302bc10@news.demon.co.uk>
Source record: 22734

I have two problems;

1) I can not use Magic 6. I have tried the patch but it would appear that it will only work with version 6.10 or.20 and I have 6.01 (I think). I have found an update for french from 6.01 to .6.10 but nor an Enlgish one. Can anyone help?

2) I have some orriginal bus booster on my Flacon (50/25 I think it is a generic copy of one). It works fine in 030 mode but crashes in 060. Do I need to set the jumper on the 060 to Boost or is that just to enable boost when you are using the 060 bus speeder? If that is not so what else coudl it be? I did thinki about removing it but I have since lost all of the little resistors, etc that I removed, plus I my soldering looks like bird sh!t.

Also, anyone got an ungrade cable they will lend me, or know where I can get one?

Anyone know where to get higher clocks too? Normal outlets appear to stop at abotu 50Mhz.

Thanks

Elliot.

it sounds like you're talking about the IDE cable and cradle. If so, I
still might go that route but my original question was refering to
replacing the the external 1 gig Seagate in a Toad shoebox which
also houses a CDROM and fan. Am I right or wrong for assuming the power
supply for that Seagate is also in the shoebox?

Message-ID: <2f399fc7.0311101620.51f16bb5@posting.google.com>
Source record: 22737

I'm waiting for a 256 meg, 133 mhz CL2 Ram chip for my CT60, and when it gets here, I'm planning to finish installing my Falcon in a Wizztronics Falcon Rack, with a new (to me) 4.5 gig 3.5 IDE HD, and new CDWR. My plan is first to flash the TOS, ABE and SDR (I have the cable.) Next I guess I'll have to boot with HDDriver to set up the HD (Repartition.) I've got 7.71, registered! (I think!) Next, use my Anodyne software to set up the CDWR. O yeah, this CT60 is going on a Falcon with a Nemesis. I hope I don't have to remove it. I just don't want to mess with it.
Anyway, does this seem like the correct order to go about things? There are enough new things with this that there are several things that could go wrong, and If anyone has a suggestion of the proper order to go about this, I'd be greatful!

Thanks in advance!

Wayne

7406. SCSI copying problems!!!!

Newsgroup: comp.sys.atari.st
Date: 2003-11-11 00:58:36 UTC

Anyone with a CT60,
Just wondering if anyone else has experienced
copying problems while attempting to backup files from
IDE to SCSI hard drive with a CT60 in 060 mode??? All
seems to work fine while in 030 mode. My falcon at
the present time is a stock 16 mhz. If so what has
anyone done to rememdy this type of problem??? I can
burn CD's on the SCSI chain and play various music
type files from CD-Rom drive and CD-Burner. But when
I try to straight copy those files from either optical
drive which are on the SCSI chain to my IDE's or SCSI
hard drive it locks up the computer!!!! Anyone
experience this type of trouble with there CT60???

Thanks for the info.
Carey Christenson

the enclosure will still be the Toad shoebox. I just want to replace
the SCSI drive in that box. The cable to the box is a 50pin MiniCentronics
SCSI II to 50 pin Centronics to the outside connector on the box. Don't
know about the inside that goes to the hard drive (haven't opened it yet :)

ok. That settles it. I definitely need the SCSI drive for Cubase. There
was a clock patch in the bird which I replaced with the one that came with
the PhantomSE speeder-upper.

>For external use, external SCSI Zip and Jaz drives are inexpensive and really

No, it's 256 MB, and this may indeed be the problem. Try a bunch of
255 MB partitions (you don't need to keep formatting, just partition)
and report back.

If you have an external CD and HD shoebox, just replace the current
drive with another SCSI drive. Watch that you match termination and
ID of the current drive, and also realize that you have to partition
larger drives. Most SCSI drives should work (at least in theory),
although you will likely have to get an adapter to match your 50 pin
cable.

Sadly, Atari is still rendered as dead as it was the day the tramps, er,
Tramiels tossed it off a cliff when they went to JTS. The transfer to Hasbro
was an utter joke and, up til recently, ownership under Infogrames was pretty
worthless, too.

The name lives on (Infogrames now *IS* Atari), but unless anyone can motive
them to get back into making game/computer *hardware*, the "cause" is just
dwindling farther and farther into utter obscurity.

Why even bring that up? The subject was availability of software!
Or may I rename it to "Piracy Kills"! I remember (not too long ago) Cox
claiming satellite dishes were dead too while motels and small cable
companies were giving away HBO for free. As a result, programmers had to
scramble signals (while blaming home dishowners for theft)! But that's
about bigger companies that can survive by gougeing the honest customers
and absorb the result of piracy! That couldn't happen regarding small Atari
software dealers and programmers!
Don't get me wrong though, I'm not living with any hopes (eh...maby a tad)
that this "new" Atari company (or the next) will ever produce hardware. But

as far as I'm concerned, as long as there are good people (as in this newsgroup) and my Falcon, Mega4, 1040 and 2600 stay alive, Atari is alive! And I regard the CT60 as Atari hardware so please don't burry me yet if I'm pronounced as dead as Atari :)

I don't know.

If you stick an IDE drive in you'll find that it's faster than SCSI BTW.

7416. Falcon RF out

Newsgroup: comp.sys.atari.st
Date: 2003-11-11 16:40:58 UTC
From: Moongravy <moongravy@ntlworld.com>
Message-ID: <ui8sb.113$0M2.100@newsfep4-winn.server.ntli.net>
Source record: 22748

I just tried connecting my falcon to my tv via rf. There is a picture but it's covered in snow. The falcon is using CH40. There is a broadcast signal on CH41 (ITV1 from Wenvoe South Wales) and this looks to be interfering with the signal.

Is there any way of changing the channel the falcon outputs on?

Regards
Mark

7417. CT060 and Magic and BUS Boost

Newsgroup: comp.sys.atari.st
Date: 2003-11-11 16:42:36 UTC
From: RSE <stuff@recycledTAKECAPSOUTsteel.co.uk>
Message-ID: <bor3fi$a9k$1$830fa7a5@news.demon.co.uk>
Source record: 22749

I have two problems;

1) I can not use Magic 6. I have tried the patch but it would appear that it will only work with version 6.10 or.20 and I have 6.01 (I think). I have found an update for French from 6.01 to .6.10 but not an English one. Can anyone help?

2) I have some original bus booster on my Flacon (50/25 I think it is a generic copy of one). It works fine in 030 mode but crashes in 060. Do I need to set the jumper on the 060 to Boost or is that just to enable boost when you are using the 060 bus speeder? If that is not so what else could it be? I did think about removing it but I have since lost all of the little resistors, etc that I removed, plus I my soldering looks like bird sh!t.

Also, anyone got an upgrade cable they will lend me, or know where I can get one?

Anyone know where to get higher clocks too? Normal outlets appear to stop at about 50Mhz.

Thanks

Elliot.

There is a screw in the back of the modulator (next to the output) which should change the chanel frequency, a slight turn should do it. You may have to removed the falcon from its case to get to it.

Elliot.

All,

Has anyone taken a look at the VME boards that are
available out there and tried to write Atari TT drivers
for these? (Just thinking out loud here.) I know that
there aren't that many TT users, but there are several
VME card manufactures around. It looks like there is
some software support by these manufactures; however,
who knows how much it costs...

Video Cards:

UK ones were around Ch36 UHF, negative modulation. I am not sure
you *can* change to NTSC as it needs a different modulation scheme
- perhaps if you change the modulator module? Also I believe the
US models output low VHF, as UHF was hardly in use in the US at
the time.

Try Farnell or Rapid Electronics. Maplins stock of
oscillators/crystals isn't the best.

Tim wrote:

> Is there a degrade util for the TT to allow ST games to run better?

No, although you have some "compatibility options":

* Set the resolution to ST-med or ST-low (if you have a monitor that supports this)

* Disable TT-ram for the program that's giving you trouble (you can do this with a good replacement desktop like Thing, or with a program I believe was called "Flags".

However, the TT is a full 32-bit redisign of the ST concept, so it wasn't really built for ST compatibility and certainly not ST games. So most games won't really work.

Maurits.

7431. ArtWorx -> 2 bombs

Newsgroup: comp.sys.atari.st
Date: 2003-11-12 08:26:06 UTC
From: Marius & Hester <grover25@zonnet.nl>
Message-ID: <bosr4o$8sd$1@reader08.wxs.nl>
Source record: 22763

Hi!

On the internet site from Application System Heidelberg you are able to download a demo version of the program AtrWorx. I was interested if this program could do what I want (To convert .WMF files into .GEM or .CVG format) ... but something is going wrong.

When I start the thing I get 2 bombs.

I have tried this package with:

Clean (it said NO GDOS -> 2 bombs and quit)
Nvdi 5.02 (no error, but still 2 bombs and quit)
SpeedoGdos 4.2 (no error, but still 2 bombs and quit)
SpeedoGdos 5.0 (no error, but still 2 bombs and quit)

WAAAAAAAAAAh it drives me crazy.

I have tried this on:
Atari Falcon 030
Atari 1040STe (4mb)
Atari 1040STfm

and on STEEM emulator.

All the combinatinos gave 2 boms.

How should this package be started?

Marius

Hi Peter,
UHF 36 is good info. Not sure if the module will be enough. May need
rearranging of circuits that feed it too. But I was just curious (for the
future). Your probably right about US models (channel 3 or 4 low vhf).
I'll ask a French guy about the other bird I have (which is ailing
badly).

Artworx does indeed import WMF files, but I don't know why it won't work for
you.

The FaST Club distributed a program called XChange which will convert WMF to
CVG files BTW.

I wanted ethernet for a TT a while ago. I looked around and found:

http://www.voxtechnologies.com/vme_network_boards.htm

I didn't think it would be too hard to write a driver (NetBSD). However,
it was the price that put me off. If I recall correctly, they were over
$400. I found a second-hand Cabletron SCSI-ethernet adapter, so I've
been using that instead.

These look nice. I wonder how much they are though and whether they'll
give out enough documentation to write a driver. I'd be tempted by the
graphics card if it was a reasonable price - the picture on my ET4000
isn't very stable.

Yeah I get *some* working by just going to ST Low and disabling Cache, but was just curious if there was a degrade util that would do more, like disable TT Ram, hacks to make game think it was a ST, slowing down system. etc. On my Amiga I have such tools that allow even my Amiga 4000 with a 68060 CPU to degrade and run old Amiga 500 games! :) If this works then surely I should be able to get ST games running on a lowly TT030 ;)

I have SpeedoGDOS and Atari Works that came with my Falcon030. I tried to install them on my TT030 and it installs fine. Works does work but, its GDOS that gives an error when Works launches. Is this not compatable with the TT? What version is know to work with the TT?

Thanks
Tim

7443. CT60 Problems

Newsgroup: comp.sys.atari.st
Date: 2003-11-13 03:10:00 UTC
From: Mark D <mducksub@removenoaspam.atari-source.com>
Message-ID: <pan.2003.11.13.03.09.59.795150@removenoaspam.atari-source.com>
Source record: 22774

Guys,

As you've probably realized, I'm very forgetful. I might have posted about this already - maybe not.

Here are problems I am having.

1. At 20MHz falcon bus system locks after approx 24 hours or so.
2. At 16MHz the system will run eternally however on running complex or long operations such as a long gcc compile strange things will happen like internal compiler errors or such - not good.
3. Upon pressing a key on the keyboard and repeating a couple times it will freeze N.AES. The mouse will still work but the AES will not respond to clicks or keypresses. Switching to a vconsole will work fine.

Info:

I am using a crappy st-ram card. Rodolphe has already said I need to replace it before he offers more help - I don't have the money right now. I have an Atari 1 meg board but 1 meg isn't enough ram for me to test anything in. I can't get the system to run at all with only 1 meg st-ram.

I have the falcon clock buffer mod installed as per instructions from email from Rodolphe. This buffer mod was needed to get my CT60 to work AT ALL even in 16MHz mode. Without the buffer mod my Falcon will run fine in 030 mode and not even boot in 060 mode@16MHz. Will not run in 20MHz mode in 060 mode or no. With the clock buffer mod resoldered per instructions the falcon works in all 4 combinations, however it has the stability issues.

I am using SDR-5D and ABE-5K, TOS .99e

I have cut the pin to activate the PLL driver of whatever, but the component is so small I am having trouble ensuring the cut is clean. Any way to test to ensure I cut properly?

I have soldered the resistor necessary for in-falcon abe/sdr updates.

Things I've tried:

Using ABE-5L in combination with my clock buffer mod @ 16MHz and also at 20MHz. No help.

Disabling SD-RAM fast ram - no help.

Next step is to attempt booting in plain 030 16MHz mode and see if these problems are around, but after using Aranym and 060 mode so long I'm deathly afraid of the slow original speed ;-)

Any suggestions or sale offers of original 4 meg atari falcon boards?
Also 14 meg known working board too. I can pay up to $50 for a
populated board after 4 weeks passes from now.

Thanks,
Mark

Well you can disable TT ram but that's about it. Although the Falcon is
a sort of "super ST", the TT was really intended to break with all
legacy and be only compatible at OS level (the world would have been a
better place if the same was done with PCs), which means ST software
will run if cleanly written. Which as you know, games aren't. :) And I
think the hardware is too fundamentally different to emulate an ST
(unless you do a full software emulation for which a TT wouldn't be fast
enough, rather than too fast). :)

> On my Amiga I have such tools that allow even my Amiga 4000 with a

> surely I should be able to get ST games running on a lowly TT030 ;)

Well for the Falcon there is such a program (called "Backward"), but I
never heard of such a thing for the TT. So I'm afraid it's not possible.
On the Atari-Midi mailinglist there are also people trying to run old
esotheric midi apps for the ST on the TT, and as with games there are
these hardware-hacking-programs that simply won't run, I haven't read
about a solution there either.

Then again, I see STs for sale on fleemarkets for 1 euro, so why emulate
when you can get the real thing. :)

Maurits.

You know, the argument _can_ be turned around:
"Why should I spend so much for an Atari from a Dealer when I can get
the same system (with extras that the auctioner doesn't realize are
rare) for 1/2 or 1/3 the price?"

The _answer_ should be obvious. Customer Service. When you get
something on eBay, you are usually stuck with it. Unless it is totally
broken, when you _might_ get your money back. Maybe.
However, the truth is that in todays world, customer service is
lacking. If you want to be the customer's choice, you need to provide
excellent and _consistent_ customer service. It is this reason I
believe some computer users would rather deal with eBay than dealers,
because some dealers are just rotten.

This has been really evident in the TI community, where dealers have
walked off with the $$$ without sending the product _many_ times.

Ben

I don't think so. The TT still has basically all the same hardware
components as the ST.

Andreas.

When counting chips the majority is the same, but still the whole system is a redesign; the fact that it's fully 32 bit is the best proof of this. Originally it wasn't even meant to run TOS. Fortunately they changed their mind on not shipping it with TOS roms by default. :)

And although the Falcon has less hardware in common with the ST, it is more ST-compatible, including 16-bit bottlenecks.

Maurits.

7452. STEEM & protected software

I keep seeing postings about STEEM and how well it works to run ST software on a PC (I have: 520ST, 2x1040ST, Mega ST2, TT030, Falcon, and Winblows XP on a dual P-III@1.2Ghz) but I don't see how you run dongle protected (Steinberg, Sonus) or funky diskette protected (Dr. T's, Hybrid Arts, ...) software with it. Also, how do you supply it with the Atari ROM images? I have considered trying it, but most of what I want to use it for is MIDI sequencing and that is mostly dongle protected software.

Larry

7453. Atari ST <--> PC via Zip/SyQuest (again...)

I've searched and seen enough answers and teasers to be going crazy on this one. I have SyQuest 44/88/200, Zip 100, SyQuest 135, and Syquest 230 drives enough to put at least one on every system that I have. (I am most interested in the Zip as the SCSI on my Falcon does not seem to work and I have an IDE Zip on it.) I have TOS versions from 1.02 through 4.04 (depending on the Atari system {ST's/Mega ST, TT030, Falcon}) as well as Windows 98se and XP Professional. I need to be able to move data between the Atari's and the PC's using one or more of these removeable media drives. I realize that there are significant partition size limitations on the older versions of TOS. But I have not been able to put the proper combination of settings tegether to get any of the media to move between TOS and Windows! I am using HDDriver 8.11 on the TOS systems (I've bought 4 copies!) and am using ICD AdSCSI, ICD Link, and Atari SCSI interfaces on the Atari's (again, depending on the system). All of the Windows systems have some form of Adaptec controller (some are embedded on the motherboard, some are on PCI or ISA cards). Please Help!!! What is the magic combination to get this to work? Where should I partition and format the media? What settings make things happy (I have tried partitioning with HDDriver and the TOS/Windows compatability mode set). Thanks for reading/responding/helping!!
Frustrated (Larry)

I have been doing some expiramentation. I went through all my game disks, and copied all the ones that were 1 filed or that were able to be copied to a directory. If I set the rez to ST Low and disable Cache I can run most! I might also have to reboot and hold down CTRL and run them from there. I have been able to get games like Rick Dangerous, Terrys Big Adv, Gold Runner, Mission Genocide, Jupiter Probe, Xenon, Better Dead than Alien, Push Over, Battle Chess, almost all Atari games like Joust, Starraiders, Moon Patrol, Breakout. All Sierra games work too, but I have to restart and boot with nothing loaded. Some disk only games seem to work too. I think the main issue is the TT Ram and CPU. I believe if there was a util we could get a lot more to run.

Well I already own 520STs, 1040STs and a Falcon, but currectly have my TT set up and my son wants to play games, thats why I have been playing around with it. But I can understand why most don't bother as the TT was meant for real work ;)

You should be okay with any TOS, as even TOS 1.00 can support partitions up to 256meg (BGM type usually). So...here's the routine.

Pick any Atari that you can get a ZIP drive properly connected with. Alot of those older ASCI/SCSI hosts you've mentioned aren't going to be happy with a ZIP drive unless you can get 5v on pin 25 (known as Termination Power). The easiest way to get this 5v online is to put some SCSI device on the bus that can be jumpered to send term power to bus. Another way to get it there, if not already, is to grab 5v from an alternate source and run it through a diode to pin 25 on the ribbon cable.

Also...I've heard that some SCSI Zip disk models need a host that works with parity, and that there is no way to disable parity on such drives. If this is the case...you'll either have to replace your HOST, or build in a Parity generator to the host you have. Adding parity to alot of the older SCSI hosts for the Atari ASCI port involves a 60 cent chip, and about 16 or so solder points.

Once you've got a Zip properly connected....
Oh, the EZ Flyer should work without doubt...it's got enough jumpers and stuff to ensure it's parity is disabled and that the unit can get TERM power from itself or from the bus...etc...

Boot everything up. If HDDriver doesn't auto boot from your hard disk...then run the disk driver from a floppy. Hopefully you'll see your Zip drive register at boot time. Next run HDUTIL.PRG from your HDDriver package. Go to the Partition option in the drop down menus. Select TOS/DOS compatability mode. Configure things so you have ONE and only ONE partition for the entire removeable media. Click ok. HDDriver will partition the Disk, and you should be set to go with a disk that will work with both TOS and DOS/Windows systems.

Another alternative is to use BIGDOS, which will let your TOS systems access pure DOS partitions.

I'm not real clear on how DOS disks work with various versions of HDDriver. I know at one time you had to be running either BIGDOS or MagiC to take advantage of some HDDriver extras. I'm thinking that with Version 8 onward, you no longer need BIGDOS or MagiC for the TOS/DOS partitioned disks...check your manual is the best advice I can offer there.

I know I've used the TOS/DOS compatability mode several times and never had to install BIGDOS, but I also was using MagiC 6.01 (which also supports the VFAT long names).

Hope this helps,
Brian

Rodolphe,

Interesting notes:

I figured out how to test with atari 1 meg board.

1 meg board with fastram and CT60 - same problem
14 meg board 030 mode with or without fast ram - same problem

SO okay.. Maybe the clock patch you told me to do is not working with my machine, but without that clock patch the system wouldn't even boot in 060 mode! I wouldn't even get a display. So I'm a little afraid to send my falcon under the knife (soldering iron) for possibly no results.

I don't know if you remember but my falcon wouldn't boot after 20MHz modifications. So you had me add clock patch according to directions you had (different than original c-lab clock patch). This got things working again! So perhaps NOW that I have a jtag cable and can install ABE-5L before removing the patch, maybe things will work.. Who knows. Now that I have more than one memory card maybe it will boot on only one of them and not my crappy 14 meg. I have test options now.

Okay, So I will go through with removing my clock patch. Odds are in my favor that I'll get a workable combination out of it. Hopefully my kitty didn't eat those resistors.

So this is what I'm doing.

1. testing software combinations. I'm going to try compiles on mint with just bash loaded.. no vconsoles, no nothing. My testing is not complete

as I've had lovely power failures due to 65+MPH gusts of wind.

2. I've got an atari 4 meg board coming. I will do some tests with that, but now I suspect that my gcc crashes have nothing to do (somehow) with st-ram.

My main suspects are what rodolphe suggests, clock patch or incompatible software. I'm working on getting my mint to boot up in protected mode as well as disabling vconsoles and trying to ruggedize my system a bit more to make sure everything is "standard" and "accepted" software.

But strange... I have these problems in 030 mode. Maybe eventually I might have to accept that my falcon is defective. We'll see. That will be unfortunate but as someone told me once, C-lab used atari reject boards possibly. Especially if I can't get a workable combination in 030 mode...

I'm strangely suspicious now of badly behaving software somewhere. We'll see.

Thanks for all the help so far!
Mark

I'm familiar with SCSI (I've been working with Xenix/Unix/Linux
servers for years as the h/w tech, and they have all been SCSI
based...). I have the Zip drive, a SyQuest 44/88/200 drive, a 2Gb DAT
drive, a CD-Rom drive, and a 300Mb CDC fixed drive in a cabinet that I
hook to the Atari's/PC at the moment. I am sure that I have power on
pin 25 (I've checked with a VOM to be sure).

I have figured out the parity issue, and found a schematic for adding
the parity generator chip you are referring to onto a Link for AdSCSI
interface. At the moment I'm using the TT030 as it seems to generate
parity and makes all the drives happy. I plan to order several of the
chips so that I have spares.

I'll go back through this again then. HDUTIL does see the Zip drive
and will partition it. But them Winblows won't see it! I've even
tried to examine the partition table using the fdisk under Linus, and
partitioning and Dos formatting a Zip under LInux, still no-go. I
will try again and be VERY careful to be sure that I get it clean this
time.

> Another alternative is to use BIGDOS, which will let your TOS systems access

I've seen several articles mention BIGDOS, but so far I have not found
much data or a source for it. Do you know where I can download it or
buy it?

The version 8 HDDriver manual is vague on this, and the TOS/DOS
compatability option in HDUTIL indicates that the ZIP will not be TOS
compatible when set to a single partition. Maybe I sould send and
e-mail to Uwe I still can't get this running. I'm also going to
re-try using the SyQuest with a 44Mb disk as that is certainly small
enough to make every one happy!

I've also seen some data on MagiC, but have had no luck finding much
information about it in english. Do you know where I can get data on
MagiC that is in english? Maybe it is an alternative I can use.

Thanks for the time to reply. The various comp.sys.atari groups have
been great as I get back into these systems. I did not realize how
much I had forgotten and how sophisticated the later Atari hardware
had gotten as the price of the new hardware exceeded my ability to
purchase it. Now I'm getting all the good stuff on eBay and if has
been a lot of fun!

I really want to thank all of the posters to these groups for their feedback and assistance!

Larry

Hi!

I read you have the parity schematics. Can you give me an URL where I can find this parity add. I think it will go with a TTL 74ls280 chip? On my Atari 8bit system I have build a few parity generators with that TTL.

I would like to make one for my ST too.

Thanks
Marius

Hi All.
Sorry I was a bit vague with my description of cqout. It it a
online auction called www.cqout.com.
You have to register, that by the by. the company I dealt with was
Liquidation stock via cqout and they had 37 4gb
scsi 50 pin hardrives in stock. They were 10 pound per item at the time.
I bought two and they work fine. Sorry for
being vague but when you do nightshift the is the first to go to sleep.
I hope this help a bit.

regards john

>
```

That can be true. But most dealers especially for Atari stuff are real good. They are professional, have quality goods, and many are NOS. I just bought a new case and keyboard from Best Electronics for my TT. Paid a pretty penny but it was worth it. It was hassel free, I used my credit card, and it a few days it was on my doorstep. I could of saved a few bucks if I found one in "mint" condition on eBay, but why bother? I am tired of half hearted cleaned up units, or even worse all grimy and yellowed! I would of ended up paying 3/4 or more the price I already paid, as people love to overbid on there. My point on my original thread is it is outrageously annoying when someone lists an item for almost the same price I can get it from Best or MyAtari. Why would I bid on that item on eBay when I can get it from a real Dealer? Heck I don't know about you, but if I wanted a new 130XE I would rather get it from the dealer for $150.00 than $75.00 on eBay. Thats just me. I can get support if something is wrong, where on eBay it is "sold as is" Just recently a 130XE sold for $132 or so dollars, it was listed as NEW, and it was from a reputable seller, but for $18 more I could of got it from MyAtari.

7470. Gemulator2000 and Aranym questions

Newsgroup: comp.sys.atari.st
Date: 2003-11-14 21:41:31 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3fb54bfc228b190@tripnet.se>
Source record: 22652

Has anyone got the latest Gemulator version to boot from a disk image?

I have tried everything(?) I can think of (including HDDRIVER!) but sofar the only solution I have found is to run AHDI.PRG from floppy. As floppy access is very slow in "Atari disk mode" this is not a usable setup.

The downloadable diskimages in gem2000x.zip from http://www.emulators.com/ works (but not bootable) but if I try to create a diskimage file with the builtin function (Tools - Create unformatted...) the result is 4 bombs if try to boot with it "mounted".

As it says "unformatted" I tried to format it with HDX but this only gives errors within HDX.PRG . Strange...

I am using an older version (dated 1/1-2001) booting from diskimages with great success. The version available for download now (dated 20/4-2001) however does not want to cooperate.

The host system runs Windows 2000 both at home and at work. At work I use Gemulator to run a rather important TSP (actually "Delivery and Pickup") application that really benefits from higher cpu speeds compared to my TT...

I've been thinking of Aranym (have it running under Debian at home) but it must be able to run under Win2000 at work without too much hazzle and as fast as possible. Which is faster for standard monochrome GEM apps, Araym or Gemulator?

Printing is a must and networking would be fun... Does this work correctly with Aranym under Win2000?

I am using a SyQuest 135 on my Falcon SCSI bus with no problems,
preferably on its own rather than in a chain. I have another one
via an Adaptec USB-SCSI converter on my son's PC. That way I can
swap carts to download on the PC and use on the Atari.

However: The cart must be formatted Atari/PC-compatible. HDDriver
8.11 will do this on your Falcon, but note that the drive can have
only /one/ partition of this type.

Regards, /Peter/

I don't mind something off-topic now and then, but I wish people would stop cross-posting to two or three newsgroups. I like to read all of the Atari-related newsgroups, and it's a pain to see the same threads on all of them.

not so easy under a pile of other external stuff (CDR/W, older SCSI
box, printer port switch box, and more, all with a bunch of intertwined
cables :) but I'll get at it and next time it will be a breeze getting to
the SCSI to replace it :)
I have some stuff ordered from Wizztronics and Best and if all goes well
I'll have both a new SCSI (better suited for Cubase....something about the
new drive not having temperature compensation) and an IDE which I pulled
from a PC. I'm not sure the latter will work or if it's any good in the
first place but I'll have the adaptor cable for the future!

Has this Falcon had the SCSI clock patch, also commonly known as the CuBase Audio patch?

I dunno about the CT60, but with the CT2B, there are a few SCSI timings one can choose built into the board. In this board's case...you scratch out the default tracer and jumper a different set of pads to get the alternate timings. Read all your docs VERY carefully. Centek does a very good job of documenting every known quirk, but not the best job in the world of organizing documentation where it's easy to find things. Read it ALL carefully, otherwise you're bound to miss something.

It could be that the IDE is just so much faster than the SCSI bus can write to these devices. Try bigger caches, which should allow for a little 'bigger bottle'...as data streams out the SCSI bus much slower than it's dumping in.

Brian

I dunno what it is about cables, they seem to tangle themselves together with no help from me :-)

More helpfully, if you see a mains lead plugged into the back of your Toad then you'll have your answer. One supply inside the box will power all the devices therein, so if you want to take one out and use it somewhere else then you'll have to make the appropriate arrangements.

> I have some stuff ordered from Wizztronics and Best and if all goes well

If it isn't a 50 pin interface then you will need an adaptor.

> from a PC. I'm not sure the latter will work or if it's any good in the
> first place but I'll have the adaptor cable for the future!

Plug'n'play if it's 2.5", adaptor needed if not. Caution, wrong connection will fry the CPU.

That is a simptom of bad SDMA clock. It usualy not strike when u have
falcon i 16colors and non expanded res or use sdma bandwith much.. it also
can happen with sdma patch, since that patch is not curing the prob, but
only make it smaller, i have quite a lot of troubles even with MkX, and
with bigger rest (736*544 for example) its almost usleless if i need to
copy a lot. It should also happen, if u copy within the scsi, esp if
copying lotsa files...

> I dunno about the CT60, but with the CT2B, there are a few SCSI timings
> one can choose into the built board.

No such soluion on CT60. But u get SDMA fixer if u install bus
acceleration though...

Janez

P.S. note, that u may have different problem, but it smells VERY like the
sdma bug.ï¿½ï¿½

Yikes!!!

I have 2, 3.5" drives (both 40 pin with what looks like a 4 pin power
plug slot and one has an extra set of pins with a jumper). The 40 pin slot
has a notch so maby the adaptor fits the notch avoiding a bad hook-up. I
have an adaptor comming but I'm not sure if it includes a 4 pin plug.
I assume the extra 4 pins on the Falcon connector is for power so there
must be something with the adaptor that will connect to the 4 pins on the
3.5" drive (I hope :)

John

I reckon u are American. And so u prolly only buy in america... BIG mistake.. U guys aee so affraid to buy overseas, so u miss better price and ppl in america use that to their advantage... Iwe got me a 130xe for 32 usd in Poland, 1050 drive for 2 beers in Slovenia, Falcon in realy MiNT condition for 40, Acorn archimedes for free in UK and so on... also a px7 from the states...

Maybe time to rethink strategie? :)

From what I understood, NET-BSD is compatible with the et4000 card. I have a Mach64 card and NET-BSD did not like it. Now if you have an old motherboard, you may be able to run Linux. I would go that that route. Linux ran fine on my Hades until I upgraded the motherboard.

Well as you know I have a Hades060 and have noticed similar
problems in a way. There are some programs that will crash my
computer unless I turn off the caches. Strange, but some programs
cannot run when the 060 is running at it's best.

It should be, but have you ever thought of getting NVDI. You may
need this upgrade to get things working better.

7487. Nasty Red Lines and Calamus SL using VDI-Print

Newsgroup: comp.sys.atari.st
Date: 2003-11-15 13:24:39 UTC
From: "Edward S. Baiz Jr." <edbaizjr@comcast.net>
Message-ID: <3fb5d49e16baafb@comcast.net>
Source record: 22668

Hello,

I found out why I get those nasty red lines all over a printed page when I use Calamus SL 2002 and the VDI-Print driver. The VDI Print drive let me use NVDI printer driver under Calamus SL. In Calamus, there is an option where you can set the minimum amount of memory that you want your computer system to have since Calamus will take all that it can. Well, if I set these minimums (ST Ram and TT Ram) to anything above 4 meg, I get those red lines when I print out anything. Of course if I print in mono, everything looks fine.

This means that I cannot take advantage of virtual memory... Is there anyone else experencing this?

Hello

I use Gemulator Explorer under win 98SE in order to access to data that are on a SCSI atari hard drive. Unfortunately, I can only access to the first of the fourth partitions.

Could you give me a clue.

Thank you for your help.

Ps. I try Gemulator but I can't access to the hard disk at all.

Would anyone happen to know what type of AC adapter works with Daynaport SCSI/Link-T. The unit itself does not specify the voltage, milliamps or polarity. It looks like I should be able to get a universal adapter that could work given the plug size, but I doni¿½t want to fry the thing.

Thanks,

Falcon manual says 2 bombs is a bus error. Not sure if all TOS bomb
errors are the same for each machine.

Please shut off the html.

Dayna has a web site, giving specs for their discontinued products.
Without looking again, I think it is 10 volts DC, center positive.

Before you hook it up, you might want to find their site, and confirm
polarity.

As I think I said before - if you want TOS/PC compatibility, you
have to use the special dual format that HDDriver offers and only
have *one* partition. I am sure that's in the manual.

I apologize about the HTML I was using Mozilla Thunderbird under OS X, but it no longer works with 10.3 so I had to switch to Entourage to read newsgroups. I'm still figuring out its settings. Hopefully the HTML is off now.

Anyway, apparently the Dayna products were bought by Intel (http://www.intel.com/support/dayna/index.htm), but no where does it list the type of specs I'm looking for.

Thanks,

You can't collect missiles. You start with a supply of 3 and you'll get a
new one with each extra life every 5000 points.
Default key to fire one is 'M' but be careful: those missiles are quite dumb
and often crash into the ground while seeking their target. Caution and
targetted firing is recommend!

A way cool game :)

cheers,
Matthias

My apologies also. The web pages I thought were still there were still
there the last time I looked. I do remember that all Dynaport stuff
used the same power supply.

If one was marked 12v center positive, they all take that.

That 10 volt number came from a 1X NEC CDROM I needed to get working
again. 12 v. is probably right for the Dyna.

I have not found the generic replacement power supplies to be
underdesigned. I bought one rated for 750 ma for a 1000 ma application,
and it worked fine, and did not get warm. I think that means that the
smallest you can find at Radio Shack will do the job.

The last I saw of the missing web page, it listed voltage and polarity
only, and not power required. It cannot take much. It only moves
electrons.

I have two of those things, an 801 and an 802, and neither of them
mention the power required.

Marius,

There doesn't seem to be any real interest. The easiest method of getting this job done would be a gtk port to native vdi calls and then compile gaim for linux on atari. Gaim has already successfully been compiled with msn, zephyr, oscar, toc, icq, etc protocols but it must use the xserver which is fairly slow on a CT60 falcon, let alone impossible to use on an unaccelerated one!

So once I get my falcon problems solved I'll get back to work on this, but this would be the path. Eventually I am creating an atari pluggable chat client called GIM. AOL Oscar protocol is the top priority but MSN could be second since I use that too.

Thanks,
Mark

I'm working from memory here....
I believe that my Gemulator setup creates itself a C partition each time it runs that has nothing on it but the hddriver and a desktop.inf file. You can't write to this tiny little partition (putting in auto folders for instance). It then puts my disk image as partition D.

Ultimately...I've switched over to STeem. STeem mounts any directory(ies) of your choice from the windows file system as a virtual hard disk. It also supports MIDI, ROM-Cartridge images, extended screen sizes, and all in all, the emulator works pretty dern well.

Drawbacks to STeem as compared with GEMulator are:
You can't mount HD images that I know of.
It can't mount drives A and B to the real floppy drive; however, you can mount the PC's floppy as a virtual hard disk. Note it has to be a disk of a format that windows is happy with. When working with floppies, it's best to make disk images and go from there.

You can't mount actual Atari Hard Drives like you can with GEMulator.
It seems to have problems loading some accessaries from hard drive that it will load fine when booting from a Floppy Image.

Definate Pluses are:
The MIDI support...
Support for just about every floppy disk image format known to exist...I.E. MSA images that are zipped can be read and run without being extracted.
You can set up games/utilities/etc as floppy images...double click them from windows and STeem will boot up a virtual atari just like that...it's cool.

It's a small download, and doesn't require HDSpace hungry hard drive images...so, It's no loss to give it a try :)

http://steem.atari.org

> I've been thinking of Aranym (have it running under Debian at home) but
> it must be able to run under Win2000 at work without too much hazzle and
> as fast as possible. Which is faster for standard monochrome GEM apps,
> Araym or Gemulator?

There is a version of Aranym that works with Windows; albeit without some functions of the versions for unix (JIT Compiler?). For most non multimedia GEM applications (like MPEG movie players) it should work just fine, and may even work with the movie players and such...just more slowly. It can be tricky to set up for the first time however...and does require an Atari type disk image to get started. In your particular case, The only real advantage I can think of to using this over a Windows ST emulator like STeem/GEMulator/Winston/etc. is if you want to run things that would benifit from high resolution displays (I.E. PhotoLine, TrueImage-paint, Imageview, etc...with lots of colors and bigger screens).

Most of the ST emulators for windows are going to lock you into the standard display modes (ST Low, Medium, or High). Some of them offer bigger screen sizes, but you're still going to be locked into the usual ST pallets and color modes. If you want out of those limitations, AFAIK your only options are MagiC PC with its specialized version of NVDI, or Aranym.

Out of the Free emulators, I've installed several on my 533mhz Celeron WinXP box w/256mb memory. I use STeem the most.

Hope this helps,
Brian

7509. Who remembers GAUNTLET? (console + PC related)

Hello, all,

In case you haven't heard the news, in the months of November and December, Midway will be releasing its "Midways Arcade Treasures" compilation for the X-Box, PS2 and (as far as we know still) the Gamecube. For those who haven't heard, this is a collection of 20 classic arcade videogames from the old days of Atari. Included on the list is the 4-player arcade classic GAUNTLET. <RANT MODE ON>: Before I go any further, let me make a direct request to Midway/TPB/Whomever it may concern: in the next compilation that gets released, please do us all a favor and give us the Gauntlet game that *should* have been released on *this* collection instead of Gauntlet: GAUNTLET II (which was, by far a superior and more challenging game to even the original). The original Gauntlet game has been translated, ported over, and emulated TO DEATH on so many different home platforms so many times that I swear I'm going to scream if I see another Gauntlet port over, that it made very little sense (IMHO) to do it AGAIN. As far as I'm concerned, a perfect port/translation of Gauntlet already exists; it's on the Sega Genesis 16-bit system: "GAUNTLET IV." Anyways, let's hope that Midway gives Gauntlet fans what they've been screaming for over a decade now: a home port of Gauntlet II that really does the game some justice (as there are many, MANY, home ports of Gauntlet already in existence). <RANT MODE OFF>

Now moving on, all this Gauntlet talk got me to thinking, "how many home ports/incarnations have there been now of Gauntlet?" I think I beat the horse to death in the above paragraph: lots and lots of ï¿½em. Being 28 years old, I remember the days of Gauntlet's video supremacy in the 80's and what follows are some thoughts on the many different home ports of both Gauntlet and it's sequels:

1) Circa 1986-87, Gauntlet was ported over to the Commodore 64, the Atari ST, IBM, and Amigaï¿½a DOS version also existed, IIRC. I never had the pleasure of playing any of these versions except the Commodore 64 one, but when I would look at the pics of the Atari ST version, it sure did look pretty darn close to the arcadeï¿½however from what I've *heard* reading old messages on the newsgroup archives re: the Atari ST version, the characters ran at the same speed, and there were no text boxes from the ï¿½DM' (or the ï¿½narrator' whose voice you'd always hear)ï¿½if anyone has played this version or any of the other ones, feel free to jump in here. The best way I could describe the C64 version was that it was "primitive but charming." Graphically simplistic but at the time, we kids were all just happy that Gauntlet had finally

"come home." All the characters ran at the same physical speed, and almost seemed to all share the same strengths/weaknesses. A year later (?), Gauntlet: The Deeper Dungeons was released for the above mentioned computer systems, adding 501 extra levels (and required the original Gauntlet to work). Again, if anyone ever got a chance to play this, I'd love to hear how good the game was.

2) In 1988 (also the year that Gauntlet II hit the arcades), Tengen released a home port of Gauntlet on the old 8-bit Nintendo system. This game was notable for a number of reasons. Firstly, it changed the basic format of Gauntlet by adding RPG/Quest elements: instead of levels that went on forever (in the original Gauntlet, the highest you can go is level 999, and once you exit room 999, you return to level 8), it narrowed the game down to 100 pre-set level/rooms. It also gave Gauntlet a storyline. Instead of being 4 adventurers who randomly fight thru the dungeons, Thor the Warrior, Thyra the Valkyrie, Merlin the Wizard, and Questor the speedy elf were now on a quest to save the land of Rendar from the Evil sorcerer Morak: they had to retrieve "the Sacred Orb" by defeating ï¿½the Guardian' in level 100 (it basically did what Gauntlet: Legends and Gauntlet: Dark Legacy would do a decade later; it was just ahead of it's time). Now, this particular version of Gauntlet seems to be universally reviled by fandom all over the internet, and to be honest I'm not quite sure whyï¿½or rather, I know why, but I think the strengths of the games far outweigh whatever faults it might have had. No, it was not *exactly* like the arcade version, but it *was* original and it *was* a *very* fun game in its own right. It also emphasized the strengths/weaknesses of the 4 characters. Any fan of Questor (as I am) would love this version because his incredible speed is the one main reason his character kicks ass over any of the other adventurers (the elf was always the fastest one, but that fact gets really pronounced in this NES version). And this version had a hell of a lot more life/character than the bland Gauntlet 2 NES port that came out a few years later. Anyhoo, has anyone ever solved Gauntlet for the NES? If so, I'd like to hear how the game ends. Do you have to face Morak's guardian (who guards the orb) and if so what is this being like in powers, abilities? Do you have to face Morak himself? Side note: Gauntlet was also ported over to the old 8-bit Sega Master System. I have never played it.

3) In 1990 (?), Gauntlet II was ported over the SMS, Gameboy, NES, and home computer systems. I've only played the NES version. This was released by a different company other than Tengen (the name eludes my memory right nowï¿½was it Mind Quest?). Hailed by many NES fans as the one "true Nintendo Gauntlet game," the sequel was quite faithful to the arcade version. Though it obviously could not measure up to the arcade version, it boasted the finest graphics and sound/digitized voice overs ever seen and heard in an 8-bit Nintendo cartridge. It really is amazing to listen to the DM's muffled voice ("Green Wizard shot the potion!")ï¿½you can almost really hear it. My criticisms of the game are so/so game control (the diagonal running/shooting

controls never feel quite right), lack of certain enemies found in the arcade version (the super-fast Thief and the Mugger), and certain game bugs (anyone else notice that the enemies tend to run AWAY from you sometimes when you attack them?). As an interesting side note: Gauntlet II for the Amiga is reputed to be the *closest* home port/translation ever of the arcade. I have never been lucky enough to play it (and would love to hear other's thoughts on the game), but it's supposed to be quite awesome, though with some glaring weaknesses (no text boxes or DM voice, same character running speed, etc.). Emulations of Gauntlet II for the Amiga are supposed to be all over the internet, I might get around to trying it one of these daysï¿½

4) Sometime in the early 90's, Gauntlet III was released on the Atari Lynx and the home computers as well. Never played this game. From what I've heard, this is actually a different game that got made over with cosmetic changes to make it a Gauntlet sequel. Supposedly a very *different* game than what most Gauntlet fans are used to (aliens??? WTF???).

5) I believe that it was about 1994 or '95 that "Gauntlet IV" was released by Tengen for the 16-bit Sega Genesis. This 4-player title boasted an all new quest adventure, a battle mode, a record mode, and the arcade mode. It is in my humble opinion and the opinion of the majority of gaming fandom (that I've seen) that the arcade mode of this 16-bit cart represents the *closest* most-faithful, pixel-perfect translation of the original Gauntlet arcade machine ever seen on a home system (console or PC). It's *almost* identical. I might even go so far as to say that it's the closest arcade port/emulation/whatever of *any* game ever done on *any* home system. Everything from the graphics, perfect game play, the DM's voice (which does get a little muffled at times), the text boxes, etc. You *will* believe you are playing the original arcade version of Gauntlet. It's just that damn good. And even in this day and age of super-powered consoles like the X-box, no version of Gauntlet before or after has come even close to matching the Genesis version. Now if only we could get a port of Gauntlet 2 that is just as good.

6) Somewhere after that time, Gauntlet: Legends and it's sequel Gauntlet: Dark Legacy were released first in the arcades, and then for the PS (G:L) and PS2 (G:DL). Different games from the original I remembered as a kid. Not better or worse, just different. And as a result, I never really got into them. And how could they ditch Questor like thatï¿½?

7) In the late 1990's Midway released "Arcade's Greatest Hits: The Atari Collection 2" for the original Sony Playstation. Like the one that's going to be released this month, this was an "anthology" of Atari arcade classics, with Gauntlet being among them. Now given the PS's obvious technological advantages over the Genesis, you'd think this latest (and now getting quite redundant) version of Gauntlet would be the best one yet, right? Wrong. Though graphically

superior, the game play doesn't measure up and the controls never feel "quite right." Something was definitely lost in the translation. Also, the individual screams and yells of the individual characters are missing. The DM's voice is also slowed down by game bugs ("Elfï¿½.nowï¿½ï¿½..hasï¿½ï¿½ï¿½..extra armor!"). All in all, a Gauntlet fan should only buy this collection if he/she doesn't already have the Sega Genesis version of Gauntlet IV.

This is yet another reason I can't understand why in this latest collection, Midway is re-releasing Gauntlet. They've *already* done it in the collection above. What we really wanted was Gauntlet II. Sigh. Maybe next time.

They are, because they are not Atari-specific (well the bombs are, but the numbers are not). :) The numbers of bombs are actually unhandled 68000 traps. And number 2 is indeed a bus error.

The only danger with the bomb-drawing method is that you might not see that you actually have two crashes in a row; so 5 bombs might also be 2+3 (a bus error followed by an address error). But I think you cannot get one bomb, so 2 is definitely one bus error. :)

The full X-server for MiNT is indeed terribly slow, but X.app (the X server that runs under GEM) is quite usable, although not (yet) complete.

If you have the protocols for MSN messanger, I guess a text-based version would also be possible, but then again that would require a rewrite instead of a port, just like a VDI version would. So I guess that's no help either. :)

Maurits.

Actually, Gauntlet and G: Deeper Dungeons were also released for the
Atari 8-bit. I had the disk version, and it supported two-player
simultaneous play and had fairly good graphics for the system.

I'd actually add a #0 -- Gauntlet was based on Dandy (a.k.a Dandy
Dungeon), an Atari 8-bit game released by APX (the Atari Program
eXchange) and written by a M.I.T. student in the early 80's. It was
based on the 8-bit computer's character mode and had the concepts of the
larger-than-one-screen maze, monster generators, and treasure chests.

Good luck with that: I have a 68 pin drive with an adaptor which took some fiddling with before it would work. Seems that there are different ways to achieve the required ends.

> I have 2, 3.5" drives (both 40 pin with what looks like a 4 pin power

You'd be best grabbing the pinouts of IDE drives from the net.

> have an adaptor comming but I'm not sure if it includes a 4 pin plug.
> I assume the extra 4 pins on the Falcon connector is for power so there
> must be something with the adaptor that will connect to the 4 pins on the
> 3.5" drive (I hope :)

I don't have any experience with this I'm afraid, I stuck with the notebook drive.

From: JM <>
Message-ID: <l8ihrvkdt7pn0mnjtp8na71tasufvqf21e@4ax.com>
Source record: 22597

Hi all,

My TT recently gave up, I tracked it down to the TOS ROMs. For some reason the machine is dead with the original 3.06 ROMS inserted, but if I stick in a set of 3.01 chips it works again.

Is there anybody out there with the right equipment and files to bake me a new set? I am of course willing to pay a reasonable fee for your time.

Thanks,
JM

Well,
the same guy that wrote Dandy (ca. 1983), also programmed Dark Chambers
(also 1983) at least the Atari XE/XEGS cart says that. And you know,
Dark Chambers is another clone of Gauntlet - but since it was originally
programmed years before Gauntlet, one can also say that Gauntlet (1985)
is a clone of Dandy and Dark Chambers. Man, if Atari had released Dark
Chambers 1983 (and not 1988!), who knows if Gauntlet would ever had been
released ?!? greets, Andreas.

Get a formatter for the ST that can format PC disks, such as FastCopy
Pro. Format a PC disk and save the files from the ST to that disk,
insert into the WinTel box and read them.

I have a Wizztronics ST Ram Card in my Falcon, but I have not yet tried to raise the speed, still at the stock 16 Mhz bus for the time being.

My machine is rock solid though, running FreeMiNT, and have been compiling, or trying to compile, lots of different apps, such as Tin, Apache, PHP, and other libraries and programs here and there.

Was actually able to get a Secure Apache running with PHP.

Anyway, I do plan on trying to do the boost eventually. I'd also love to goto 100 Mhz, but don't know if that will happen.

Anyway, goo luck finding a RAM card, you are not the only one searching.

Keith

Hello,

Anyone else catch Andy Rooney at the end of 60 minutes this past Sunday? He was talking about how long it took Wondows to boot up and shutdown. He also mentioned how stupid it was that he could not just turn off his computer and how many times he kept getting the notice that certain programs he was trying to run made an illegal error. It was really cool. Too bad he did not mention that others computers like the Mac, Atari and Amiga did not have these problems.

Dandy was written by John (aka Jack) H. Palevich, released (I believe) in 1982
for the Atari 800 (as part of the Atari Program Exchange). It was later released
and re-titled as Dandy Dungeon by Antic The C64 version was ported by Nick
Pelling (aka Orlando M Pilchard) for Electric Dreams in 1987.

> and home computer systems.

Yep. I played Gauntlet II quite a bit in college (which gives you an
idea to my age) and purchased it for the Atari ST. The ST version is
quite close to the arcade version and is one of the few Atari games
that had 4 player capability.

The Atari ST version is similar, although I believe it does have the
Thief. I haven't played it in a couple of years.

Yep. I don't own it either, but I remember thinking at the time that
this wasn't the Gauntlet I remembered. (I do own two Lynxes and about
20 games.)

I believe most floppy's come pre-formatted for PC which can be read
by both the PC and Atari. If I'm correct, then all he has to do is copy the
files to those disks.

Notator/Creator/Logic won't work AFAIK...unless someone's fairly recently found a way to do it. Even if they do...you can pretty much rule out the possibilities of things like Export, Unitor, LOG3, and so forth. The Notator dongle apparently does more than just simplecopy protection. It must alter currents, voltages, clocks, and so forth. Trying to get an 'image' of these dongles yeilds zilch....as it's not a standard ROM dongle.

I've not tried any Steinberg stuff yet...not even the dongle free version of CuBase Lite. IF one of these does work however...there is a slight chance you might can use the Parallel devices such as the SMP24 or the STMIDI3 interface...depending on how MROS chooses to access a ST printer port.

There are indeed a number of quality MIDI applications that are reported to work with STeem however. Many of them are legal to download free these days. Too much to list!...so...check out this really good site on ST MIDI.
http://tamw.atari-users.net/

As for funky disk formats...
Some of these are so funky that you can't make copies on your ST either (without tracking software, and in some cases additional hardware). In these such cases...there are a few things you can try...but more than likely You'll need some hacker help...someone with the tools and knowhow to make a disk image for you that can be loaded into the emulator.

First, try using disk image software on your ST that attempts to disreguard any concept of understanding the disk format, but instead tracks the disk and 'dubs' an identical copy. I've never tried this, so I have no clue where to point you in terms of program names and their abilities. I've only used the bog MSA utility...and I've no idea how it goes about its task. Someone else jump in here?

The main reason a Wintel floppy has problems with weird disk formats...can't even see Amiga or Apple disks...is because of the cheap floppy controller most of these machines have. As 'progress' takes hold, the floppy drives themselves

also begin to reach a point where they only see one or two formats. If you're really serious about emulation...some Floppy controller cards can be found that plug into a PCI slot on your PC, that with the included software, and when matched with the proper floppy drive, can access and copy pretty much every floppy scheme ever come up with.

STeem is a small download...easy to set up and learn...so you're not out a thing by giving it a try.
http://steem.atari.org

Hope this helps:
Brian

I used to have a program for the ST that was called fastcopy I believe.
It had a huge display of green and red tracks of the disk (80 per drive).
This would copy games, etc with complete disreguard for error tracks,
copying the broken track in it's entirety so the game worked. This worked
for some sierra games I believe?

Two of my absolute ALLTIME favorites are:

Secret of Monkey Island
Stnoe Age

These games are great and work fine on monochrome atari ST system. I don't know if the 'cracked' versions do, but I have the original disks, and they work fine on mono.

FDI works with any device providing 44.1 and 48 clocks and having optical or coaxial connector. I tried it with MD, DAT and CD and they all work fine with Cubase Audio.

yep, I also didn't manage to start Magic 6.01, it seems that it needs ver.
6.10 or 6.20...
I think that the Falcon MB can't be boosted from two sources at the same
time...:)
So, either you use your old booster and switch off CT60 boost or use CT60
boost...
oscs could be found at www.buerklin.com

That may work indeed, with a preformatted 720K disk that is. A 1.44 M
disk will have to be formatted to 720K on the ST, but with a utility,
not the built-in TOS formatter. I have tried to format 720K disks on
the PC, but then my Atari won't read it. I think it also matters what
TOS version is used, later versions seems more flexible.

JM

They were all flexible, but the PC isn't. :) But what you are referring to, is that from TOS 1.62 (ie from the STe on), disks formatted from the Desktop are DOS-compatible.

However, any replacement formatting tool (FastCopy, Kobold etc) for the ST will do the job.

On the other hand, you can also use GemExplorer on the PC to read pre-1.62-Atari-formatted disks, but apparantly that doesn't (yet?) run under XP.

And then there are other cool options, like connecting ST to PC with a nullmodem cable and transferring the files using a terminal application or setting up a PPP link between them and use ftp. :)

Maurits.

Or connect the ST MIDI out to the PC MIDI in, set PC MIDI clock to
slave, set PC MIDI app to record, and hit play on the Atari MIDI
app... :-)

But this will only be necessary if the files on the ST are made in a
program that cannot save .mid files.

It works. I made several tests these days with two different hard
drives. On one drive i have an older MagiC 6.01 and it works with all
the patches of of CT060_404.LZH -> Folder "Magic"
(with NVDI 5.01)

NVDI replaces whole ROM VDI and is much faster. It also includes GDOS, and supports vector fonts (True Type, Speedo, Type1).

I'm looking for a Link97 for my STE, as I understand it's the only host adaptor that allows SCSI arbitration.

The reason is that I want to connect a Pioneer CD ROM drive and a Yamaha CD-RW drive to my STE that I used to have connected to my Falcon.

Both drives worked great on my Falcon with ExtenDOS Gold. But with my STE and old ICD Link 1, ExtenDOS Gold doesn't "see" either drive. And I've discussed this with Roger Burrows of Anodyne, and he's informed me that both drives need SCSI arbitration in order to work.

So, does anyone have a used Link97 for sale, or know where I might find one?

I'm in southern California, USA.

Thanks all.

Hi!

I'm not sure, but perhaps is the 'parity' the real problem. You might try to switch of parity with one of the jumper settings on the drives. I have used The Link II (that's the second version of your ICD Link) and that worked fine, because it supports parity drives.

On all my 3 cd'roms the parity could be enabled/disabled by jumper 4 (right next the 3 SCSI ID pins)

Give it a try!
Marius

7557. strange problem with used/free space on HD

Newsgroup: comp.sys.atari.st
Date: 2003-11-19 08:01:46 UTC
From: Marius & Hester <grover25@zonnet.nl>
Message-ID: <bpf85g$f2q$1@reader10.wxs.nl>
Source record: 22639

Hi!

I have a REAL strange problem with my harddisk on the atari Falcon 030.

The problem is on any partition.

When I write files on it and checks how large all folders are (checking each folder apart) I get in total 45mb.

But when I check the information on the drive via the desktop menu. I see it's 77mb!!!!

That's not right, and my is getting full too early this way. Is this a problem of the HD driver or something else?

Greetz,
M.

p.s. I'm using Hushi.

7558. PNG plugin/decoder for CAB?

Hi folks,

does a PNG plugin or decoder for the old freeware CAB exist for viewing
inline PNG images without an external viewer?
If so, does it work under plain TOS on an unexpanded Falcon?

cheers,
Matthias

7559. Re: atari midi files on PC?

Newsgroup: comp.sys.atari.st
Date: 2003-11-19 09:18:20 UTC
From: Marius & Hester <grover25@zonnet.nl>
Message-ID: <bpfcr0$9hl$1@reader08.wxs.nl>
Source record: 22641

The problem is clear!!!

When you format a HD disk on 720kb the PC is not able to read UNTIL you close the small square right (not the write protect one, but that thing on the other side) with some tape or paper!

As long as the square is OPEN the PC "thinks" it is a HD disk, and expects it to be 1.44mb. The atari ST don't look at that square, because it is only DD drive.

When you close the square with tape or paper, you are able to format it on 720kb on pc and the atari ST will be able to read the disk too.

Be carefull -> HD disks do have another bias (the magnetic level of the disk), and some atari ST drives don't like those HD disks very much.

Greetz,
Marius

p.s. MIDI files are general. You have general midi 0 and 1. PC and ST can handle both files.

Hi Maurits,

Why is the msn messenger not very populair with atari users? In early days (only a couple of years ago) "everyone" was using ICQ.. .but now: all my friends are on the MSN. But... I have already encouraged 2 of them to use ICQ, so I won't be lonely when I have switched to the atari falcon completely to internet.

Greetz,
M.

Peter's answer already contained some hints on what to keep in mind when using the compatibility mode, so this might help.

I do not find you in my list of registered users, by the way. Can you plase send me the serial number of your HDDRIVER? Thanks.

Best regards, Uwe

It's just like "nobody uses Linux" or "nobody uses Atari".. just that groups of people encourage each other to make a certain choice and then when you look around "everyone" appears to use something. I'm in the middle of two "everyones", everyone using IRC and everyone using MSN. Personally I think I only know one or two people who ever used ICQ.

I can tell you why MSN messenger is not popular with *me* though: :) I hate the program itself with its incredibly ugly layout, the fact that most people configure it with silly fonts and colors that I have to look at when they talk to me (not to mention the 500-character-long names), and the fact that it's yet another m$ attempt to take over the world.

IRC rules. And is available for all platforms and independant of monopolists. :)

Maurits.

> for some sierra games I believe?

Yes it was much more flexable when it came to disks and their formats but it was still based on tracks and sectors, it was good but not that good (Fastcopy Pro had 1.44 support too). I have most of the hardware copy stuff that came out (Blitz Turbo (both versions), Synchro Express, etc) and they were better but still could not do 100% of disks.

Synchro Express (the best) spent hours copying one disk, hmmm "syncing" each drive to each other than then doing multiple reads and writes to the disk to try and work, it was supposed to be a "mirror image" of the orriginal as apposed to a "data image" of the orriginal.

A good example is Golden Axe (the orriginal, not some crack or one from a box set), this had a good "physical" protection and none of the above managed to copy it.

PCs are just sh!te at disk asscess, most of them you will be lucky to get to work at more than 80 tracks, the drives, drivers and controllers are very simply and cheap. Best to go and find a crack.

Elliot.

I had all sorts of problems with this too (soem time ago), I gave up. Many people were saying it had probems with 2K and XP and I think I did some tests with a 98 machine and it worked better. People even put this to the maker but he said it was fine in all Win versions, so.....

I use Steem and play with WIn Arany from time to time, when it gets better I will use that the most I think.

Elliot.

7577. Compatible Atari 800 Disk Drives

Date: 2003-11-19 23:57:11 UTC
From: rox@bargainisp.net
Message-ID: <6117dee8.0311191557.4e9e3f1a@posting.google.com>
Source record: 22559

I have a lot of Atari 800 video games on double sided, double density disks with OSA/+ V4.1 operating system. This used to work well on Percom drives, but these drives no longer work or are not available. OSA/+ doesn't run on stock Atari drives. Is there some other drive I can buy that will run these disks ?

Hi!

You have posted this in the ATARI ST newsgroup, but I guess you have more luck in comp.sys.atari.8bit

By the way:
The DOS version on atari 8bit is not the reason why you aren't able to read your disks anymore, but the size and density. A stock 1050 can only read single density (90k) and "medium/enhanced" density (130k) ... an upgraded 1050 with happy is able too read "double density" (180k) but all disks are single sided.

You might want to buy an atari xf551. This is a real double density, double sided diskdrive (360kb), and should be able to read your disks.

Btw. There is a program that could read 360kb formatted atari 8bit disks on pc. Perhaps you have a PC with 5.25" disk? You could read your disks with the 5.25" drive on PC, store the files on your PC hd, and then convert them back with Sio2PC or APE or equal on the atari 8bit

Greetz,
Marius

p.s. in Poland there was also the "tom's drive" ... seemed to be great too... but very RARE ... so I guess the best option is the xf551... but I don't like that drive at all (except for the 360kb option)

I would suggest to download the demo version of CAB 2.8 from the ASH
website. It is almost fully functional. Only the hotlist doesn't work
(create one with your free CAB version and use that one in CAB 2.8).
Get the Dan Ackerman's CAB.OVL for STiK/STiNG, or, if you use MiNT,
the special CAB.OVL for MiNTnet (with SSL support !) and there you go.

Most important, CAB 2.8 supports PNG images. By the way: So does the new
and free Highwire browser. Have you tried that already ? It can't do
everything yet, but it is getting better with every new release.

Seems like a very good idea to me - hotlist is not a problem as that is
rather rudimentary in CAB.

> Most important, CAB 2.8 supports PNG images. By the way: So does the new

I've tried Highwire but I doubt it will work networked under plain TOS.
I do not like to use MagiC and Mint is not an option due to memory and hard
disk limitations.
PNG support in Highwire is broken btw., it does not render interlaced PNGs
properly.

I'll go with CAB 2.8 - doesn't hurt to try that out.

cheers,
Matthias

Not web. FTP. There are a complete set of files, from several disks, at

chapelie.rma.ac.be

They are probably in Utilities, and the file name is probably Diablo.

>problem of the HD driver or something else?

How large are your partitions? I ask because large partitions use large sector/cluster sizes. Your first check only returns the actual number of bytes occupied by the files. The desktop menu however effectively counts free and occupied clusters and multiplies these by the cluster size, so even a 1-byte file will count as the whole sector used - reasonable, because nothing else can use the remaining space as you can only access clusters with the OS. So if you have a large number of small files, they will all occupy at least one whole cluster, which can be 32 kB or more and this quickly adds up!

On my Falcon, my C: partition is 52 MB and this uses 2048-byte clusters (twice that of floppies). The remaining partitions are some 800 MB and those use 32768-byte clusters!

Regards, /Peter/

7602. Falcon and CD-ROM

Newsgroup: comp.sys.atari.st
Date: 2003-11-21 18:18:48 UTC
From: Paul Lefebvre <atari@logicalvue.com>
Message-ID: <BBE3C13C.39AA%atari@logicalvue.com>
Source record: 22584

I have recently purchased a Falcon030 and am trying to get it to work with an AppleCD 300e Plus SCSI CD-ROM drive. My Falcon has TOS 4.04 and is running V6.04 of the Atari Hard Disk Driver (AHDI). I also have ExtenDos 1.4 (yes, itï¿½s a bit old).

When I boot the Falcon, it says:

SCSI Devices: Unit 0: Not Responding

But the ExtendDos set up seems to work OK as the driver is recognized (as a Matsushita) and I get the message that says logical drive P: has been installed.

If I do an ï¿½Install Devicesï¿½, drive P: will get added to the desktop. However, double-clicking on the drive always brings up this message: ï¿½Drive P: is not responding. Please check the disk drive, or insert a disk.ï¿½

I have the following hardware on the SCSI chain and Iï¿½m at a loss to know if it is set up correctly. I have tried lots of different combinations, but nothing seems to work:
* AppleCD 300e Plus connected to the Falcon via a SCSI 50-pin centronics to a SCSI 2 50 pin cable. On the CD-ROM I also have the cable plugged into what may be a pass-through terminator block. It is set as SCSI device 5.
* Chained to the CD-ROM is my DaynaPort SCSI/Link-T with a SCSI 50-pin centronics to a DB25 cable. This is set as SCSI device 3 and has its terminator dip switch set to ï¿½1ï¿½, which according to the web page means to terminate.
* Both units are powered on when I boot the Falcon and there is a CD in the CD-ROM. I am not currently using the Daynaport for anything yet since I havenï¿½t yet put the software on the Falcon.

I am thinking I may not have the terminators set up properly, but I donï¿½t really have any way to know.

Any help that anyone can provide would be greatly appreciated.

Thanks,
-- Paul Lefebvre

Wdialog or perhaps N-dialog, is needed also by NVDI, as I just found out.
NVDI complains of lack of memory to run in without Wdialog. I did not know
that Wdialog was for allocating memory, but it seems to be true.

BTW, two bombs is a doubled bus error, and usually means an attempt to
write to location zero twice in a row, and can mean that proper memory was
not allocated.

I have not tried ArtWorx. Maybe I should. Suggest, for no particular
reason, that you try N-dialog instead, and see if that helps.

I would also suggest booting without anything you do not really need,
until you get ArtWorx running.

What Hard Disk driver is installed?
There are a couple of different ways ExtenDOS can get at CD-ROMS, depending on the version you have and so on. ExtenDOS can work stand alone...or it can go through the SCSI processor of disk driver software that supports SCSIDRV. In other words...ExtenDOS can install and use a SCSI.RAM of it's own, or it can try to use an already existing one.

Once we've established what SCSI/disk driver you have installed...lets first try to get it working independent of any hard disk disk driver software. Use your hard drive set-up utility to configure it so that it totally ignores the ID that your CD-ROM unit is set for. It could be that what ever hard driver software you're using is conflicting somehow. Having it 'skip' ID 5 certianly will not hurt, and just 'might' solve the problem.

Next, let's take a look at the CD you have in the drive. Make sure it's not damaged, or passibly a home burned job done on a finiky burner. Is it an ISO format? If it's a disk that was made by, or for a Mac, it just might need an additional driver set up with Extendos before you can read said disk. Check the ExtenDOS docs carefully, as it has a section that explains how to read Mac CDs. Some older versions of ExtenDOS required you to set up two different logical drives on the same device....one for accessing ISO CDs, the other for Mac CDs.

Finally....
There are indeed some Mac CD-ROM devices made (Phase-writer in particular) over the years that had an optomized for Macintosh mode. If your drive has this...it usually can be disabled via jumper. If your drive has it...disable it. I'm not real clear on the differences between Mac and PC mode on such a drive...but I think it has something to do with devices on LUN1 rather than LUN0 (each SCSI ID can have two LUNs, and apparently some CD-ROM drivers can't see the second LUN??? I'm guessing here...???).

Beyond this...It's likely a cable or termination issue.
Make sure that the last device in the chain, and only the last device is terminated.

Also...it appears that ?some/all? Falcons...for whatever reason(s) don't supply 5v termination power. Devices set up to SCSI II specs will need to get this 5v from somewhere or they won't work properly. Drives intending to be compatable with multitudes of systems usually have a variety of jumper settings revolving around this 5v current. If your drive can get term power from itself, this will usually set things straight. Sometimes, and more and more common each year...you find devices that expect this 5v to be there, and can not be set to get it any other way. If you run across such a device, then you need to find a way to get term power on your SCSI bus. The easiest thing to do, is to have a quality/compatable, TRUE SCSI II (Seagate stuff is excellent in this reguard) drive on the chain, and set the jumpers so that it supplies 5v termination power to the BUS, and from then on, anytime you install a new device it can be set to get termination power from the bus, or from itself (either is fine...but now you have 5v there for drives that MUST get it from the bus). Another option is a bit more complex, and can be confusing. This option is to get 5v from an external source and run it through a diode to the termination line in your SCSI cable. This 5v can come from your drive's power supply, the Falcon's, or you can even buy an adequate brick type power supply at your favaorite electronic supply store and tap it in. Which line is it? That's a good question! The SCSI specs I've seen say that term power is on pin 26, and that pin 25 is 'unused'. This gets even more confusing when you start mixing 25, 50, and larger pin SCSI cable standards. A few of the Atari ASCI hosts claim to use pin 25 to get their power (I believe this refers to a 25pin type cable...while on a 50pin/lead cable it's gonna be on pin 26?)...I myself am still confused about this...so ask around if you don't have any SCSI device that can put termination power on the bus, and I'm sure some of the more knowledgable people here will get you on track.

Hope this helps....
Brian

I just had the same problem with an Apple 600E. The drives are embedded with Apple code and will not be seen by the Atari or a PC. Ditch the drive and get a full scsi compliant unit. I had to.

Hmm, I really don't think you need Wdialog or N-dialog for NVDI. I've used during years NVDI without Wdialog/N-dialog on TT030 and Hades060 both running freeMiNT/N_AES. Because some newer application requires Wdialog or N-dialog to run I do use n_dlg052 on both machines nowadays. But as said even without both machines boot up properly. I think the memory problem must be sought somewhere else like for instance wrong setup of NVDI. Take a look at nvdi.inf to see if you can find some bad things.

Now about Artworx. I donwloaded the demo version of Artworx (2.09) and yes it does run without wdialog or N-dialog. According to the German readme file you must have MAGICMOD.LMD in the MODULE dir if you run Artworx with another system then Magic. I tried it without and yes Artworx refused to start up but I do get a proper warning about that. I haven't tried it under plainTOS though. The TT030 isn't set up to work under plainTOS. I stopped using plainTOS since late 1995. I probably would find it a hard time to work under plainTOS. Currently I don't have the time to setup a system just for testing purpose.

That's interesting. I hope I don't have to toss the drive. I based my
drive purchase on the page at Anodyne that says the AppleCD 300 (and 600)
would work with it. Of course I am running a much older version of ExtenDOS
(just 1.4, not Pro or Gold). I'll check with Roger Burrows to see if he has
any recommendations. Perhaps I'll get lucky and just need his new software.

Wow! That's a lot of information!

> What Hard Disk driver is installed?
AHDI 6.04 came installed on the Falcon. It looks like AHDI 5 is included on the master diskettes I have. Perhaps I can make a boot disk with just the ExtenDOS driver on it.

> Next, let's take a look at the CD you have in the drive.
I have tried a couple CDs, both specifically for the Atari: Suzy B's Software Treasury and Crawly Crypt Archives. They work fine on my Mac so I doubt they are damaged.

> Finally....
> There are indeed some Mac CD-ROM devices made (Phase-writer in particular)
> over the years that had an optimized for Macintosh mode.
Someone else has mentioned a problem using Mac CD-ROM drives. Since Anodyne lists this drive as compatible with ExtenDOS Gold, perhaps I just need the newer software from them.

Thanks for your help,

Hey folks!

Given the problems that I've found with my CT60 installation and what actually turns out to be my falcon, I was wondering if anyone had software that stress tests specifically the memory (st ram and fast ram separately but both), the cpu, the sdma (if that's not stress tested through one of the other tests), etc. Is there any such software for atari? I don't really know of any off the top of my head.

Thanks,
Mark

7617. Have an accelerator card - need some help (HBS 640) - for Mega ST

Newsgroup: comp.sys.atari.st
Date: 2003-11-22 15:24:08 UTC
From: Rob <notator_logic.atat@hotmail.com>
Message-ID: <t3vurvo1ttk159h51ljt7q6mis6219tskt@4ax.com>
Source record: 22499
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi all,

I managed to get hold of what I believe to be a 16mhz accelerator card for my Mega ST1. It came with a disk, and a german manual, on the front of which it says HBS 640.

In the manual there are chapter headers for 260 &520ST, Mega St and also 1040ST.

As i said, the model I believe I had was for the mega ST, but taking the machine apart, there doesnt seem anywhere obvious where the card will fit (it won't go in the expansion slot like I thought it would)

Does anyone know where I can get some assistance in fitting this, or where I may find a manul in english that may shed some light onit (or tell me if it's the 260.520.1040 model (which will therefore be of no use as I don't own one)

Looking at the set of pins on the back of it, it appears it goes where the biggest chip on the mother board is, but as I don't know wether it goes inplace of the chip, on top of the chip or whatever (as it happens, I currently have a small IC board soldered to the center 7 pins on that particular chip, which i think is the clock.)

Any light shedding, gratefully accepted.

Rob

P.S. Among the german spiel, it does mention 16mhz, but also does mention something about 25mhz, which would be rather nice.

I'm trying to update my ABE chip, using the JATG cable from Andreas.
If I understand it correctly, one must lift the CT60 board off the
Falcon MB when flashing the ABE. But whenever I do this, the Falcon
won't boot! No FUJI, nothing but a blank, grey screen! What's wrong?

Just solder a (1K to 10K) resistor between pin 1 and 10 of one of
the 3 ICs right to the 40 MHz oscillator, then you don't need to
unplug the board to update it : just switch to 030 mode.
Have a look at Rodolphe's pages, all is explained.

J.-Luc

You may have forgot to put the jumper back in the expansion slot.

But it's best not to have to unplug the card as suggested by JL.

Bye,
/Pascal/

Yes, the wiper blades are new old stock (NOS) from a long time ago. I finally found an easy way to fix them. Take one newer wiper blade, from just about anything, and with fingers and a very sharp knife, remove that wiper blade from its holder. Then, pull the dead blade off the SLM wiper metal, and clean off anything left behind.

Glue the new blade to the old metal, with just about anything that works to hold rubber and metal together, from your local hardware store, and follow directions. Possibly apply pressure with wood scraps and c-clamps while the glue dries, sets, or whatever it does, and put it back in the SLM. If your luck is anything like mine, you might have to try the glue routine again, if the new rubber flips out of place when you try to use it. And, always, take the drum assembly out to work on it.

Jim

>drive and get a full scsi compliant unit. I had to.

Rubbish...
Both the Apple 300 and 600 CD-R's work perfect with Atari. I've had both models connected to respectively a MegaSTE, TT, 1040ST and a Milan. IIRC the 300e had a Matsushita mechanism and the 600e a Sony. The drives came both factory installed with internal terminators, so you either had to make sure that they were the last one in the SCSI chain or open up the cases and remove the terminators.

Cheers from Belgium
Dennis

>Of course I am running a much older version of ExtenDOS (just 1.4, not
>Pro or Gold). I'll check with Roger Burrows to see if he has any
>recommendations. Perhaps I'll get lucky and just need his new software.

Of course you don't have to toss the drive, in the mid 90's hundreds of
Atarians used these drives on their Atari.

Go to the chapelie ftp server ftp://chapelie.rma.ac.be/atari/ and download
SPIN! or METADOS, and that's all there is to it really. I've no idea how
good the current versions of ExtenDOS Pro and Gold are, but the older
versions weren't much to shout about... :-/

SPIN or METADOS don't have an installation program, but it's quite easy to
set up, just put the whole lot in the AUTO folder and edit the config.sys
file like this: for a CD-R connected to the SCSI port with ID 5:

*BOS, C:\AUTO\SCSI_CD.BOS, Y:15
*DOS, C:\AUTO\ISO9660F.DOS, P:Y
And that's all there is to it, when you reboot you should be able to access
the CD-ROM as drive P.

When you opt to install SPIN! (the better choice) then the config.sys
should look like this:

*BOS, C:\AUTO\SPIN_SD.BOS, Y:15
*DOS, C:\AUTO\ISO9660F.DOS, P:Y

Note that you need to download both programs, SPIN! comes without a *.DOS
driver, but there's one included in METADOS.

With both these drivers you'll be able to read most formats and also play
Audio CD's, SPIN in addition can also read Mac HFS CD's and extract audio
tracks to WAV.

>I am thinking I may not have the terminators set up properly, but I don?t
>really have any way to know.

My 300e and 600e used to have their termination factory set, so you'll
either have to use it as the last device in the chain or open up the case
and remove the terminators.

Cheers from Belgium

By all means, get the latest version of Extendos. That, as far as I know,
will handle all of the possible kinds of CDs. That might be your problem,
and then again, maybe not.

And, while I am at it, I just put terminators on a SCSI drive at SCSI-1 on
a TT bus, a ST32250w, which would not work without it. Now it does. A web
search says it is a quite unpredictable drive, but this makes it work.

Further details on request.

Jim

Thanks! Yes, I saw those instructions, but my soldering sucks! I've
realized that my problem is that I need to put the jumper that I
removed from the buss slot back when flashing. I just can't remember
which pins it came off of. Can you describe the pins to me?

Sorry for the ignorance and ineptitude!

Wayne

You never install a new wiper blade without lubricating it and the drum
first. Toner works just as well as commercial padding powder.

good blades will always flip if installed without lubricant, if it turns
easily without lubricant, its not going to last long, or its already
buggered.

Also remember to change the Fuser cleaner wand regularly, if not, it will
destroy its Teflon coating prematurely. These white felts are impregnated
with silicone oil. Generic fuser felts are available from any remanufactures
and you can refurbish your own.

> exactly this option but somehow missed it.

Start the steem engine.
Click on the the little wrench in the right hand side of the window.
That brings up the 'options window'. You'll see listed along the left edge of
the window various option pages you can tweak. Click the one that says
'Machine'. Here you can select the machine speed, RAM size, the screen mode,
the keyboard language, and a ROM/Cartridge image.

To set up a directory from your windows file system as an ST hard drive...click
the little file cabinet drawer. Turn on the partion(s) you want and select the
directory from your windows file system directory(ies) wanted.

Hope this helps,
Brian

Yes, I realized that is exactly what I did. I wanted to avoid
soldering anything, since my soldering skills SUCK! As Rudolphe said
when he looked at my CT2B MB, " When I opened the package, I had a
vision of Horror! Who did this? The solders looked like big turds!"
;-)
OK, damn it, I'll solder the resistor. For now, does anyone know which
pins the jumper went on?

I apolgize for my ignorance, ineptitude, and other general
shortcomings! I'm just a musician!

Wayne

There is a U-shaped white marking next to these two pins.

The resitor that avoids removal of the CT60 for flashing must be installed
on the pins of a surface mounted chip, so if you solerding skills are low
you have to be very careful not to create short circuits between adjacent
pins !

The HBS series of accelerators replace the CPU. I'm not sure what is
needed, but you may need to socket your CPU, the 68000 and place the
HBS in the socket. I'm getting an HBS 240 soon. It's 16Mhz, so your
HBS 640 may be faster , like 24Mhz or something.

The little circuit you said about might be the FPU patch on top of the
CPU. Not sure what you would do with that, remove it and the FPU
maybe as the HBS has a socket for FPU AFAIK.

The jumper goes on the too pins marked by W11 written on the motherboard.

Hi Lyndon, I'll take a couple of photo's and post them on, see what
you think. (Personally not brave enough to go unsoldering the CPU and
re placing it with this one _ I had enough trouble building a moniter
cable)

Rob

There is *nothing* wrong with the Artworx demo. I did give it a try under
plainTOS and guess what? It works.
There must be something wrong on your side. I'm not common with Magic so
I can' help you with that. In another posting you have said you just
renamed magixboot.prg (or whatever that thing is called) to magixboot.prx.
I can imagine that this isn't just enough to reboot properly under
plainTOS.

It's a common practice in newsgroups to put the reply below the quoted
text. Please can you follow that pratice?

On some MB, there is not the U shape but just W11 (have one). On some
others, there is neither the U shape neither the W11 indication.

Fixed font:

```
.......................
Connector J16 .......................

W11 (between pins 20 and 22)
__
||
2 ............... 30
1 ............... 29 connector J20
```

Bye,

Hi All,
Does anyone know where corrected Falcon schematics or just the corrections can be found? I have 2 sets (one for 500047-001 REV B and the other for 303007-001 REV L) and both have the same errors! It would be even nicer to get corrected set for 481332-003 REV B but any set with corrections would be welcomed!

John

Actually what I'd like to see is a Gauntlet classics Xbox Live enabled package. It would include Gauntlet and Gauntlet II as 4 player online enabled Xbox Live games. I'd also like to see Gauntlet Legends done as an XBL title -- note Dark Legacy (or whatever it was called, it was too "dark" the graphics not the story line).

If you say so ... :-)
Anyway there was a reason why I said that. I remember a friend of mine who had a hard time to reboot his Hades to plainTOS after he had used MagiC. One warm reboot wasn't enough. He had to reboot several times before he could use plainTOS.

Take care,
Martin

Hi all,

I need to mail to Holger Weets. He used to have an address on the
MausNet at ol.maus.de but this domain looks to be dead. Any idea on how
I can get in touch?

Thank you.

Bye,
/Pascal/

Yes. Eiffel.atari.org has it. It is not a minor task, however. They
may still be available from Lyndon Amsdon at hardware.atari.org.

Perhaps this link will help you. I did not try the address myself, just
did a quick search...

http://groups.google.se/groups?hl=en&lr=&ie=UTF-8&selm=1fpt7zu.9widb0e9rpgsN%25deaf_null%40hotmail.com

...and found a one year old email address.

I found it was easier and cheaper just buying a 1040STe with 4MB from eBay!
;) It is in pretty good shape too and works just fine.

7669. Re: Falcon and CD-ROM

Newsgroup: comp.sys.atari.st
Date: 2003-11-25 18:14:43 UTC
From: Paul Lefebvre <atari@logicalvue.com>
Message-ID: <BBE90642.3B5B%atari@logicalvue.com>
Source record: 22452

Thanks for the many tips, Dennis.

Unfortunately the CD-ROM is still not working. I've tried the MetaDOS (2.7) and Spin drivers but they do not work for me either. MetaDOS installs the drive, but I get the same "not responding" message from the desktop. Spin won't even install the drive, telling me the SCSI device is not responding during bootup.
I've also tried another Falcon-specific driver, F030_CD that I found on the internet but that hasn't worked either. I've even tweaked a few settings in ExtenDOS, but there has been no changes.

I've tried the CD-ROM both with and without the "term power" jumper, but it doesn't appear to operate any differently.

Perhaps my drive is just bad.

Thanks,

-- Paul

I think you'll find that a warm reboot will still leave MagiC -
or parts of it - active. It needs a cold boot/switchoff to be sure
of using TOS. Of course it helps if you've got a boot manager
such as Xboot or Stoop (Falcon-only) where you can switch off any
AUTO, ACC and CPXs (but not the MagiC START folder PRGs - but if
MagXboot is not on, these don't matter). In fact I have a setup
where only Xboot loads, so I have a naked machine for tryouts etc.

Regards, /Peter/

So it's possible remains of Magic are still there after a warm reboot?
Can this be the cause of the troubles the OP has with Artworx?

Off topic for this newsgroup but nevertheless interesting

And where can we find that how-to? URL?
Does Calamus SL2003 works too? The only reason why I still use Windows now and then is Calamus SL2003.

Hi Marius,
May not make a difference with your problem but I don't think FPATCH2
is used with NVDI. The demo loaded fine on my 030 with single TOS 4.04
Auto folder has HSMODEM (etc), STIK2, DSPXBIOS, NVDI 5.03, WDIALOG 2.04,
EXTENDOS GOLD, JPEGD, MACCEL34 (different order).... no MAGIC, CDARGEN.BOS,
CONFIG.SYS, FPATCH2.PRG, HSMAY86.DOS, ISO9660F.DOS, METADOS.PRG or COPS.

John

7679. Syquest removable Atari to PC

Newsgroup: comp.sys.atari.st
Date: 2003-11-26 18:37:29 UTC
From: jon
Message-ID: <xp6xb.5383$ZE1.2799@fed1read04>
Source record: 22461

Ok, I need some help on this one. I have a Syquest 200 meg removable and tons of disks. I know that you can format a floppy to work between a PeeCee and the Atari by keeping it standard FAT as long as you have TOS 1.4 and above. The ST/e I'm using has TOS 1.62. Why doesn't it work on the Syquest carts? They are standard SCSI devices and the drive will work under Windoze EXPEE as well as the Atari machine. I have formatted on both machines and find they don't communicate on both machines.

I'm stumped on this one. Can someone shed some light?

Thanks

7680. Re: Falcon and CD-ROM

Hi Dennis,

DV>just put the whole lot in the AUTO folder and edit the config.sys file
DV>like this: for a CD-R connected to the SCSI port with ID 5:
DV>
DV>*BOS, C:\AUTO\SCSI_CD.BOS, Y:15 *DOS, C:\AUTO\ISO9660F.DOS, P:Y
sorry, but doesn't an ID 5 correspond to 13 (8+5)?

In my CONFIG.SYS 12 and 14 correspond to IDs 4 and 6, respectively.

I don't know if my remark is important to the solution of the
problem...

I just asked a friend (hardware freak) who told me that there really
were some (very few) Apple SCSI CD rom drives that were not recognized
by Atari computers because of firmware reasons.

If that's true, I'd be astonished, for I thought you could hook every
SCSI CD rom drive to an Atari and have it run (as least as data reader)

Und TTschï¿½

Message-ID: <Hcaxb.138$s7.0@bignews6.bellsouth.net>
Source record: 22462

On a Falcon CT2b running MagiC 6.01:
Yep, I've got a version of ENEC2.STX patched for the CT2b....

I can ping fine over the Ethernet connection. I can browse the web with increadable speed, everything seems great. The problem is that every single zip, prg, (executable binary) etc... file I download gets corrupted...when I go to unpack the file, text files unpack fine, but the binary stuff (*.prg,app,etc) usually fail the crc check.

I get these corrupted files reguardless of what software I use to grab the file (CAB, ftp, etc.).

Is this just a matter of tweaking some variables somewhere in STing?
Any hints/ideas out there for the offering?

Thanks,
Brian

PC and Atari FAT are only identical to 32MB, 4 partitions. After
that, you will require some additional software.

7683. [MagiC] Path Overflow Error

Newsgroup: comp.sys.atari.st
Date: 2003-11-27 00:38:24 UTC
From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <RLbxb.484$s7.152@bignews6.bellsouth.net>
Source record: 22464

What causes a path overflow error in MagiC?
Is this when directory levels get too deep (path line is too long for a buffer or something)?
If so, is there a patch or fix for this besides limiting how many directories deep I go?

I get this error, usually when getting drive info, or doing a desktop drag/copy to my 'shadow' backup partition. It seems to give it about the time it hits the MagiC folder.

Here's the funny thing. The deepest directory on my entire system is the GEMSYS/Magic folder as installed with the installer. Some of those utilities and stuff that come with it have a pretty damn big path line! I'm gonna move some stuff around and see what happens...however, I'd still like to know if there is some way to increase the limits of whatever causes this error.

Thanks,
Brian

> Any hints/ideas out there for the offering?

I think I found the problem(s)...
Read up on TCP/IP stuff (what a way to spend my night off!)

Turns out my router prefers an MTU (Maximum Transmission Unit) of 1442.
The MSS (Maximum Segment Size) should be MTU - 40 (a packet header is 40 bytes
so subtract this), so that would be 1402. The RWIN (Recieve Window) should be
2-10 times MSS, so 2801 goes here.
I chose a multiple of 2 because the ENEC docs imply the buffer in the N2000
isn't all that big (it suggests a RWIN size of 5500).

Summary:
MTU: Should be set to your router and or isp's recommended number.
MSS: Subtract 40 from your MTU.
RWIN: Multiply MSS by 2 (Or any number between 2 and 10 depending on what your
networking device can handle without overunning buffers).

It seems to be fixed...off to actually use it now, and see if it's really fixed
;)

From: jon
Message-ID: <LIexb.5668$ZE1.407@fed1read04>
Source record: 22467

Ok, I partitioned the carts at 30 megs each. I formatted them on the PC
and then moved them over to the Atari. The Atari doesn't see the cart until
it's reformatted on the Atari. I can then summarize that the Atari in no
way, shape or form, likes the format the PC is doing to the cart. I have
it as a standard fat format.

This is likewise from the Atari to the PC.

There must be something that is messed up on one of the OS's that won't let
them talk.

Thanks for the suggestions.... I guess using the Syquest as a cross platform
device is out of the question. For the record, the software I have tried
is ICD's format utilities. Atari's AHDI gets lost when I try to even boot
the drive. I even tried booting with the ICD Link II I have. It see's and
boots the drive (even allowed me to boot Mint from it) but, after formatting
the cartridge, it can't been seen on my PC.

With HDDRIVER (http://www.seimet.de/hddriver_english.html) you can
create a single partition on your cartridge that is both PC and Atari
compatible. DOS/Windows and the Atari can read/write data on this
partition without any additional software.

No, this is not limitation of HDDRIVER, on the contrary. HDDRIVER is the
only driver that supports partitions > 32 MB that are both PC and Atari
compatible. Please refer to the manual for details.

>Every zip larger than a few bytes I grab with this interface is corrupted.

Note that tcp transfers use checksums internally to check if data has
arrived without errors. This error checking takes place inside the STinG
tcp module(?). If any errors are detected here STinG will force a second
request of the packet.

This means that up to this point the data is error free. the corruption
takes place somewhere between STinG and te client program. But, as STinG
operates interrupt driven in parallel with other tasks anything might
influence on anything, really.

My oldest Mega2 will corrupt RAM contents at random (binary ones becomes
zero) whith any sort of dongle placed in the cartridge port. Tested with
several Cubase and Masterscore dongles. Even happend with the old Fast
BASIC cartridge (but never tested with EtherNEC). This error has to do
with a chip that can't deliver enough current resulting in voltage drop
and is a well known design error on early Mega2's

What kind of corruption do you get? Binary errors? Data loss?

Get the file comparison program ï¿½gale and compare known good files with
corrupted ones.

I'm using EtherNEC + STinG with a TT here and it works really well.
Rather sensitive to how STinG is setup but no data corruption whatsoever.
I have transfered lots of GigaByte data through my EtherNEC and never
spotted an error.

I was wondering this....
I 'think' some acc, cpx, or other TSR is messing things up.
I come to this conclusion because having disabled all but the bare minimum apps at bootup I've seen much more success at grabbing larger zip (and other binary data) files uncorrupted. Since cutting to the skivies on booted apps, I haven't seen anymore corrupted files (only a dozen or so tested thus fat). I'm down to these things, in this order now:

Falcon CT2b 14/32mb RAM, FPU, EtherNEC/N2000.
HDDriver 7.93, EIDE drive, all SCSI devices currently unplugged and disabled.
MAGIC 6.01(I've the quazi protected boot strapper in the auto folder, the RAM is patched for CT2b).
STING Latest version w latest tcp/ip,udp,etc...stx, and the CT2b hack of enec2.stx
NVDI 5.03 (this or fVDI is required to boot in the TOS 7 accelorated mode).

ACC:
COPS

CPX:
FGENERAL (This MUST be used with CT2b to disable blitter and caches or GEM don't work).
NVDI Control
Magic Config
Magic TimeSlice
Sting Internals
Sting Protocols (All the needed protocols active, no extras like Draconis threads).
Sting Ports (Only the NEC2 STX is installed/active since I don't use dialin, serial, or plip connections).

The desktop is Magix, as supplied with MagiC 6.01.
I'm booting in 640X480X256color 80 column mode.

Now, under this ultra lean setup (lean for a beefed up Falcon :) I've had success grabbing zip files up to 700k in less than 3 seconds without them becoming corrupted! That's using the following STing settings:
Interrupt Timer, 10ms
MTU 1442
MSS 1402
RWIN 4206

We'll see how this holds out, and I'll gradually add back my boot time bells and whistles to see who the bad guy is (if that's the problem). Of course the first priority will be the enhanced resolutions with videlity or centscreen. I already miss all that screen-real-estate and color!

One small thought. TOS seems to occasionally mess up transfering big
files. There is TOSFIX.PRG to break transfers into smaller blocks.

If you cannot find it, I can mail a copy.

Jim

No it's not - I use a SyQuest EZ-135 both on my son's PC (Windows
XP) and my Falcon (actually I have two, one on the PC and one on
the Falcon, and only move the carts).

> For the record, the software I have tried

>the drive. I even tried booting with the ICD Link II I have. It see's and
>boots the drive (even allowed me to boot Mint from it) but, after formatting
>the cartridge, it can't been seen on my PC.

Instead of AHDI of ICD, you need HDDRIVER 8.x (commercial - available
with English manual from Atari Workshop, or a demo version is
downloadable from author Uwe Seimet's website
http://www.seimet.de/hddriver_english.html).

With that you can produce *a single* PC-compatible partition on the
Atari. Alternatively, I believe MagiC on the Atari will see a
PC-formatted partiton, even if it's over 32 MB. TOS should see smaller
ones, though I am not 100% sure of this.

Regards, /Peter/

I sometimes have the same problem when I download using Cab and
Dan Ackerman's OVL file. If I switch the OVL to the MagicNet or
MintNet one, the files are file. Also, I have turned off my caches
and sometimes this works. If you are using STZip, you may want to
try out ArcView. It works a lot better for me....

Hello Julian,

That is an awful big hassel. I would just keep that machine and
just buy a 4meg STe. That is what I did.

With 14Mb memory, as many as you like! B^)

Start off with 100 FAT and 1000 Data and you won't go far wrong.

regards
Harry

I've been working a bit on Taskbar lately, fixing bugs and trying to get
it working properly under MagiC. I hope that the problems related to icons
under MagiC are gone now, as well as some problems with the control panel
(under both MagiC and N.AES). If anybody would like to test this version
and help me debugging it, please send me a mail.

7717. HD Update!

Newsgroup: comp.sys.atari.st
Date: 2003-11-30 08:23:27 UTC
From: swamptaxes-NOT-@atlantic.net
Message-ID: <3Ohyb.263$Q76.283467@monger.newsread.com>
Source record: 22399

Hi All,
Got a new HD installed :) from Wizztronics. Plugged right in with their adaptor :) Had to make a frame since the old drive was a 5 1/2" (I guess) 6"x4"x3" doorstop! The new one is only 4 gig (full height) but supposed to better for Cubase since it doesn't have thermal recalibration unless it's not being accessed. I'm hoping it stops the crashes I've been having. It's also supposed to be faster but Anodyne's Xferrate.ttp shows the following (not sure how to interprate the results but it looks not much different to me):
Old (1 gig) New (4.2 gig)
ST51080 ST15230W SUN4.2g
Rwabs 1480-1460 1480
XHDI 1470-1340 1480
Note: running on a 14 meg Falcon with Phantom excellerator
Haven't messed with the IDE and adaptor yet.

John

7718. [UPD] December Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2003-11-30 09:20:24 UTC
From: Francois LE COAT <lecoat@lutece.net>
Message-ID: <bqccoe$ep1$2@news-reader1.wanadoo.fr>
Source record: 22400

Hi,

The software "Eureka" is updated and released on its WEB page.
It is a "2D Graph Describer and 3D Modeller". It is updated
nearly every month, if I found significant improvements for it.
You will have to fetch it at :

http://eureka.atari.org/eurka312.zip
That is the Complete Common Edition

http://eureka.atari.org/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.atari.org/eurka020.zip
Is the Complete 68020 Edition

http://eureka.atari.org/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.atari.org/lib_dgem.zip
Are Dynamic Libraries Extensions for Eureka

http://eureka.atari.org/tiny045.zip
Is the OpenGL Extension (requires previous package)

The main improvement for this release is that Eureka is
supplied with a new OpenGL dynamic library called
"TinyGL 0.45". So, all proposed download files are
updated (see above).

I wish you big fun with all this new STuff !

Best regards,

-- Franï¿½ois LE COAT
Author of Eureka 2.12

Hallo John!

JG>It's also supposed to be faster but Anodyne's Xferrate.ttp shows the
JG>following

JG>Rwabs 1480-1460

That's quite normal for the Falcon, as sadly the SCSI bus isn't designed too
good.

The drive will be faster only for search operations (head positioning will be
more speedy).

On my Milan, I get the following with a SCSI drive:

Bus 1: SymSCSI0
06.00: WDC WD400BB-75DEA0 05.0 Direct Access
Rwabs() transfer rate: 5250-5240 kb/sec
XHDI transfer rate: 5160-5150 kb/sec

Well, actually this is an IDE drive, but connected to SCSI with an ACARD
adaptor.

IDE is much slower on the Milan :-(

Bus 2: Milan IDE
00.00: FUJITSU MPC3064AT 6018 Direct Access
Rwabs() transfer rate: 2010-1980 kb/sec
XHDI transfer rate: 1990 kb/sec

mit freundlichem Gruï¿½ aus Bubenreuth

Hey guys.... here's what I have up for trade:

Pocket PC e355 2003 (in new condition) (some specs:)
Intel PXA255 XScale 300Mhz Processor
3.5" Display
64MB RAM
Comes with 10 Screen Protectors (Memorex)
Leather Case
USB and Charging Base
(Pocket VCS is pretty cool on it!)
-In perfect condition, I just never use it with all the other PCs I have-

Sega Saturn
1 Controller
Grid Runner & Virtua Fighter 2
(D , but only the first disc unless I find the other one)
Composite Video Cable

I'm looking for:

Atari Lynx with healthy boxed games selection
Atari 7800 with healthy boxed games selection
Atari ST or STe in very good condition
Atari Mega2 or 4 Setup
Atari TT030 Setup
Atari Stacy 2 or 4

Please e-mail me with any offers! Always willing to deal and trade!
Thanks......

Well, that actually makes me feel better (thought the drive wasn't as advertised). Would the CT60 improve transfer rates for recording to a Yamaha R/W CD drive?

SCSI on the Falcon will not get faster with a faster processor. This is because the SCSI/DMA hardware stills runs with its normal speed. IDE transfers may get faster though.

Hi Uwe,
I should have mentioned that when I ran Xeferrate I had the Phantom excellerator installed (50mhz clock to Combel and DSP....25mhz to the CPU, FPU, SDMA and the Expansion bus. Would that effect SCSI ? If so I'm surely at max!

Hello all!

is there somebody who bought his SDRAM module (preferrably 512 Mb one) online from some www shop?
And which 512 Mb module (brand, type and code) is tested to work on CT60?
(in other words - which module is in accordance with the data supplied on www.czuba-tech.com?)

thanx!

I say experiment ;)
Too many variables exist from set-up to set up, such as the type of drive(s) and applications, and the style of operation you're using.

Try things and see what seems to work best for you.
It'd be cool if you'll tell us what you discover :)

Brian

AIUI FAT caches affect the speed of accessing files in the root directory, while data caches affect sub-directories. On a hard drive, there isn't much in a root directory to bother you to have more, but with 14Mb memory it shouldn't make a difference.

I can't remember the amount of memory each cache has (1Kb I think) but it may be affected by the number of Kb per sector on the drive (big partition, big sectors).

For a far better discussion than I can manage, take a look at the docs for NCBCS - a very small utility based on CACHEnnn (and includes those docs too). I think CACHEnnn forced you to have the same F and D cache numbers, while NCBCS allowed them to differ, like in the HDDriver settings.

HTH

I am not sure. What about the SCSI controller? Does it also run faster.
I don't think that any chip can simply be overclocked.

I would not waste any time on these cache settings. Using a fast
operating system like MagiC is much more efficient than for improving
performance than, for instance, using 500 caches for data sectors
instead of 400.

Good news!

This weekend after i read a message in the DHS CT060 forum, i start to play with the parameters in N.AES config file, at the beginning i only changed the values of this parameters qsbchars, cqsbchars, mpipesize and sstack but still got crashes . Then i tried with other parameters.... i changed GEMCON= from FALSE to TRUE and after reboot the freezes were gone.....

- Freeze with ST-GUIDE while scrolling with arrow keys.....gone
- Freeze with the BubbleGem CPX module.....gone
- Freeze with Z-Control while using text editors or the console.....gone

I was for more than 6 hours "hardusing" the computer and it didnt freeze.

7747. Papyrus X vs. Tempus Word

According to Nick Harlow of 16/32 Systems the English version of Papyrus X is upon us and was to have been on demonstration at the MicroMart show in Birmingham's NEC this last Sunday. Anyone care to give us a report on this?

Stepping up into the other corner though is the English version of Tempus Word. Already reported upon in this newsgroup, a lot of work has gone into this project.

Now's every English-speaking user's chance to put these two heavy-weight contenders through their paces. Will Tempus Word's greater speed overcome Papyrus in the clinches?

Keep an eye on the Tempus web site <http://www.tempus-word.de> (click on the flag in the top right corner) for the latest news on the release.

Hey Rudolphe,
Regarding the SCSI transfer rate:

Since my Falcon is overclocked by the Phantom excellerator (50 mhz to
Combel and DSP.....25 to Videl, CPU, SDMA and Expansion bus) does it efect
SCSI ? If not, can the transfer rate be improved?

I'm beginning to look a bit silly here B^)
Yes, it only affects the speed the root directory from the FAT appears.

>> while data caches affect sub-directories. On a hard drive, there isn't
>> much
> The data caches affect any data sector, that's why it is called data
> cache!
>
> The names are actually self-explanatory.

Aren't they actually called directory caches? Contents of a sub-directory
aren't stored in the FAT, so it holds the list of previously accessed
sub-directories for fast displaying, rather than suffering the delay of
opening a sub-dir containing lots of files (like a fonts directory).

I didn't notice any difference in other areas.

ISTR this only made a big difference in the days when I only had floppy
drives...

At the Birmingham Micro Mart show on Sunday, 16/32 Systems had an
English version running on a Hades. Unfortunately due to NVDI
problems one couldn't really try it out properly.

Anyone know what the differences from V8/9 are?

I am currently translating the Temups-Word NG TWA file into
English, using TW to do it. In many way it's faster and the
auto-correction works like a dream; it seems more flexible than
Papyrus, but still lacks some of the facilities, such as marking
all occurences of a given font/size so that they can be replaced
easily. I too find it difficult to make up my mind!

You know, it's one thing to top-post, breaking one of the more articulate
and 'loose' of Usenetituette's terms, the rules are there for ease of use by
others; a common courtesy if you will. That said, trying to be a rebel by
flaunting that particular courtesy makes you look less like a rebel and more
like a....choad, really.

Hi!

I have bought an atari Falcon with build-in Falcon Speed. The software on
the HD is version 6.0 and I have read somewhere there was an update (6.3?)
... How to get this update?

Please help!
Marius

No SCSI transfers are not increased by a boosted bus !
The NCR53c80 chip is limited to a theorical rate of 3 MB/s....in fact the
real rate on falcon is 1.8MB/s at 16 MHz and at 25 MHz !

But the bad effect you may have with boosted falcon bus is a SDMA clock
problem... Sure this must be corrected with good CT60 fitting with solders
like explained on my wen site !
If you have problems with SDMATEST software (on my fitting page !) with the
phantom, you know what you have to do...remove phantom and use F30 booster
OF the CT60.

Ok. I ran your test program and it shuts the sound off. Sound is ok only
after a reset (CPX reload has no effect). Should I be hearing anything
while the program is running?
From what I understand if I had an SDMA problem with it clocked at 25
mhz I should hear clicks. Please note that the Phantom came Ctirad's
version of the clock patch (chip that replaces the resistors) that I
believe is for the click problem. I've never heard clicks using Cubase.

7762. DUST (Disk Utility for ST)

Newsgroup: comp.sys.atari.st
Date: 2003-12-03 03:07:49 UTC
From: iquitted@collegeclub.com
Message-ID: <bba8af7b.0312021907.3b8061bd@posting.google.com>
Source record: 22444

Does anyone know if DUST is still supported? It's this Mac utility that converts Atari ST disks into images that ST emulators can use. I have version 1.0.4 and I'm wondering if there are any newer versions. The author's email doesn't seem to be working anymore, nor does the DUST website.

If DUST isn't supported anymore, can anyone recommend a similar utility?

thanks,

jeremy

if I understand correctly, normally the SDMA is clocked at 16mhz.
Combel gets 32mhz with 16mhz out from Combel to FPU, CPU, SDMA....
so if Combel gets 50mhz then it outpus 25mhz. So it sounds like you went
from 16mhz to 40mhz. The rest is over my head!

> higher settings as suggested (100/999)?

Definitely. 10 would be used up with every directory you go into.
100/999 would allow a lot more hits.

Note: i only mentioned 100 FAT caches because I rarely have more then a
dozen folders in a root directory (I keep about 12 separate partitions).

I'm selling an Atari ST shareware disk library. It includes over 120 disks. Each disk has several programs that fit into a particular category (Utilities, Games, Communication, Graphics, etc). The disks are all clearly labelled to make it easy to find what you're looking for.

Many of these programs are really fantastic and hard to find now. There are also several disks with demos of popular commercial programs from back in the day.

I'd like to sell it to someone who will enjoy them. I'm asking $15 plus shipping.

You can call me at (314) 521-2072, or you can email me (remove everything between JOSH and the @ symbol in my email address above)

ok. So my confusion was related to the clock patch which distributes
16mhz to FPU, CPU, Expansion bus and SDMA (pin 110). The SDMA 32mhz I
believe comes from the DSP crystal. If so, mine is at 50 mhz with the
Phantom SE (25mhz to pin 110). Just a guess but maby your SDMA did'nt work
do to a different timing multiple (40 to SDMA and 32 to CPU, etc.) ?

Thanks

If keyboards are same why do online places charge 75 dollars for one
when ST ones can be got on Ebay for about 10-15 dollars?

Is there anywhere (resource) that tells me the differences as I might
need a new Falcon PSU

Well items at a online dealer will always be more expensive than eBay!
Thats understandable isn't it?

Also the Falcon KB is dark gray and not white like the ST(E) KB's...

Tim

This isn't understandable. Sorry ;-)
$75 for a keyboard versus $25 for a machine? Mhmmm...
I can understand a 20% markup. Not 300%.
Besides, a falcon keyboard isn't the same thing as an ste keyboard,
perhaps they are indeed more expensive because they are rarer and such.
That would be a good explanation, but I'm referring primarily to other
more commonly available items.

Anyway, that's the beauty of free enterprise, the retailers can charge
whatever the market will bear, but I personally don't understand the
markup and I'm entitled to that opinion.

Mark

7780. Communiqué from Rodolphe Czuba

Newsgroup: comp.sys.atari.st
Date: 2003-12-03 23:37:47 UTC
From: Remi Villatel <maxilys@SPAMCOP.normandnet.fr>
Message-ID: <bqls4c$dc5$1@news.tiscali.fr>
Source record: 22312

Rodolphe asked for a translation. Here we go... But don't forget to reply to
him, NOT to me. I ONLY do the translation.

In consequence of a swindle from the society VERNAL ELM to which I ordered
060s that I never recieved, I lost US$1728!

Needless to say that this will seriously affect the development of the
PCI-USB card for the CT60!

If somebody has a long arm to the US embassy in France, it's the right time
to let us know... because this kind of international litigation is very
unlikely to be resolved through usual ways. A miracle is needed...

Somebody in USA wanted to help but he's not in the right state and it's a
too long way for him to go and kick some ass!

If the Atari fellowship could link us to US citizens willing to do an
incursion over there or, at least, willing to help me to start a legal
action on their side of the Atlantic.

For the moment, PAYPAL --with which I paid-- is still investigating but
doesn't refund unless you complain in the 30 days after the day of payment.
It was on july, the 28th... so no refund from PAYPAL...

I feel sorry to know that corrupted people spoil the Atari world over there too!

For the moment, I've missed fourteen 060s and it's obvious that the last
sendings will be delayed.

And I can't even refund the buyers...

Needless to say that even if I find other 060s, you'll have to wait until I
have the money to buy them...

You can't always do what you want with the family resources.

So, DON'T BY 060s FROM:

Vernal Elm LLC
239B Front St.
New Haven, CT 06513, USA
sales@vernalelm.com
FAX: (720) 294-4128

They don't deliver any more!!!

A Swiss has been racketed too while paying by VISA! And according to what I
read, there are other ones on eBay.

I was told that the society is located in a nasty area full of dope! Imagine what these $1728 became...

On Wed, 03 Dec 2003 21:00:54 +0000, Meffy <methanoid_AT_@hotmail.com> had a noticeable pleasure while writting:
> Is there anywhere (resource) that tells me the differences as I might
> need a new Falcon PSU

Falcon PSUs are better then ST (can handle bigger load) and have diffrent connector to the mainboard.

Hello All!

To be exact it Papyrus X was running on my '060 Milan at the Micro Mart show, and despite
the font problems it did look like an impressive package.

I must say the font problems were most probably due to my lack of knowledge when it comes
to NVDI setup and lack of english documentation when it comes to running software on the Milan.

I will download Tempus Word and give that a go, but as for a full report on the UK Micromart show,
I am sure that www.myatari.net will provide one in their next issue.

Regards,

Richard.

North's Toupe) enlightened us by scribbling this gem of wisdom:

Gauntlet II came out in 1986, not 1988. I actually played it at Time
Out (In Cerritos Mall) around 1987 ....

It would be nice to see Gauntlet II released, as well as an enhanced
version with more / faster monsters, different mazes, etc.

<Gibs> When you kill 6 people in Unreal Tournament
it is "MonsterKill", In Quake3 it is "Excellent",
in Counter-Strike it is "Kicked by console"

%300 mark up? That's an interesting number, seeing as a 'dealer' has likely invested alot more than $25 in said inventory. He might break even at $75...seeing as he likely borrowed the money to stock his store in the late 80s or early 90s at 12% interest or something like that...when the stuff was indeed sky high to begin with.

The keyboard on ebay, is more than likely an individual who paid full price for the stuff 12 years ago, and is just cleaning out his closet.

Also, I'd love to know where on ebay these $25 machines are! They rarely CLOSE out that low, and when they do...it's often so much crap in the box it'll cost $100 to ship it home. Also watch the fine print...a lot of auctions have a MINIMUM $20 s/h fee and such rot as that.

Sure, ya might get lucky and get a working machine for cheap once in a blue moon...but how many hours of your time will you spend scouring freaking auctions and camping out at the bid button to win stuff that way? Hell, I've been trying for years to get these $25 machines you're talking about. Unless I camp out at the computer at closing time...I always get beat by a penny when making low bids. Sometimes, when I bid somewhere around the going dealer rate for such items...I get lucky...but more often than not...I'm beat on those as well.

> Anyway, that's the beauty of free enterprise, the retailers can charge
> whatever the market will bear, but I personally don't understand the
> markup and I'm entitled to that opinion.

You are entitled to that opinion, but you're also a bit diluded about how easy it is to get a complete ST machine, or even just a working keyboard, for only $25 at the end of the day.

And that's my opinion.

What I meant is that you will pay more at a dealer vs eBay. Since eBay is a
fleamarket. And most stuff at a dealer is NEW not used.

I do agree with you the prices can be outrageous. I just got a Brand New
USA TT030 Keyboard for $125.00 at a dealer. If I can find a keyboard like
this on eBay I would surely buy it, but I do not think one will ever come up
like this one in my lifetime. So I will just pay more and have it now...

I would rather pay $125.00 for a NEW in the box keyboard, than pay even up
to half or less for a used one. Not sure about you but I like New looking
and non yellowed Vintage Atari gear! ;)

7787. [CuBase Audio] White noise static from S/PDIF FDI!

Newsgroup: comp.sys.atari.st
Date: 2003-12-04 03:36:54 UTC
From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <NWxzb.527$i83.66@bignews5.bellsouth.net>
Source record: 22319

Lucky me...
I finally found an FDI, but it doesn't seem to be working...or maybe I've missed something.

Fist, the FDI is connected to an Analogue 8 box via little ribbon cable, which in turn connects to the falcon DSP port.

I've checked all the cables and connectors with a voltage meter, and they all seem to be just fine.

So, when I load CAF, it syncs to the clock rate of the FDI as it should. I can play out to to S/PDIF devices and it works just fine, both R and L channels. For input on the other-hand, The right channel sounds just fine, but the left channel is nothing but static...even when there should be no audio signal being sent at the time. Unplug the coax, and the static disappears. This is with a good coax cable BTW, that's been tested with other gear and fails not. I get the static in the L channel with every S/PDIF device I have. In essence, I've eleminated the possibility of bad S/PDIF gear, and I'm pretty confident it's not a cable problem.

Any idea what might be causing this and how I might fix it?

Thanks,
Brian

> If somebody has a long arm to the US embassy in France, it's the right time
> to let us know... because this kind of international litigation is very
> unlikely to be resolved through usual ways. A miracle is needed...

It will be tough indeed...I've gotten burned by overseas deals before as well. Mine was the other way around...from US to Europe, and it was such a piddling amount of money in the eyes of the law, that it just got swept under the rug. Hell, those Nigerian swindlers that took alot of people for billions are still on the loose...

With this in mind, I think your best bet would be to contact the better buissness beuro here in the states. They can tell you if this buissness has had other complaints. If they have several cases mounting up agaisnt them over here...maybe you can get your name on the list as a well, and steak claims if any class action type settlement is ever won agaisnt these guys that actually has enough left over to compensate people they ripped off.

A good place to start is with any of your US coustomers who ordered CPUs from you. I'm not sure how you worded the deal, and handled the money, but there just might be a way your US coustomers can file agaisnt these people.

Chances are, you'll never see your money unless you can get PayPal, VISA, etc, to insure it. I do hope it turns out differently tho'...and that at the least these guys go down and justice is served. After the years melt by, and if any action is taken...the lawyers take their share...it's unlikely there will be much left to pay back people like yourself that they've scammed.

In the mean time, you could always have a little Atarian good will drive to get you back on your feet. As a very satisfied CT2B owner I'd toss in a few bucks if someone sets up the fund.

Good luck,
Brian

The subject line was actually OK. This encoding is often used when there
are other characters than 7-bit ASCII. In this case ï¿½ (e with ').

It was (now corrupted by Newsie) encoded in the special header variant of
Quoted Printable. Just be thankful he did not use Base64 that really
needs decoding to be readable.

As Newsie has no support for anything but 7 bit ASCII it will fail on
just about any language except English. The main reason wht I use Okami,
btw. A mail/news reader that can't handle the letters ï¿½, ï¿½ and ï¿½ is
impossible to use in Swedish.

An expert with a little too small cache memory, perhaps :-)

The default settings in HDDRIVER 8.03 are:

FAT cache 10 sectors
Data cache 10 sectors

If I understand it correctly the memory space of 10 sectors on each
partition is used for the cache sizes. Do all partitons have there own
caches in memory? If not, this becomes a bit puzzling.

The size for each cache entry is the same as the size of the biggest
logical sector on the drive. That's the way the GEMDOS cache works.

I still have a supply of new, boxed Mega STE kbrds, Spanish keycaps, which
will work with the Mega and TT.

Price is £30 GBP plus shipping.

You pays your money.....

Check out this auction for the Atari Falcon. Is this how much these units go for?

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2769914634&category=51107

Seems outrageous to me.

I'm going to top post this, just to keep the subject intact.

I have one spare 68060 that I will mail Rodolphe, and will make a
PayPal donation. Hopefully others can help out. Last year I was ripped
off by a contractor here in California for over $3500.00. It was
impossible to get any of the cash back. The court let them file
bankruptcy for over $175,000.00 in cash deposites and loans.......

I also have some small jobs, if he wishes to undertake with his new
bus analizer:)

I adapted an AT (not ATX) psu so as it could fit the Falcon's
connector : very easy, indeed ;-)
The only problem is that it can't fit in the original case :-(

7808. Hard Drive for STE

Newsgroup: comp.sys.atari.st
Date: 2003-12-04 21:59:46 UTC
From: Allan Davis <acs@webaxs.net>
Message-ID: <bqoaof$29lj$1@arachne.labyrinth.net.au>
Source record: 22340

I am looking for the best solution to put a Hard Drive on my 4 Meg STE.
Cost, capacity, ease of use are the main considerations. It doesn't matter
if it is SCSI or IDE although I may want to put a CD-ROM onto the system at
some point which may indicate that SCSI would be the better option?

May be a second hand unit could be the go?

Any body who would like to share there ideas please go ahead!

Thanks

Internet and mail fraud is so rampant in the US that the authorities
rarely do anything about it besides add to their database of
complaints. (They do go after the worst offenders, but from what I
can tell, most victims never recover anything.) If you wish to report
your loss, I'd suggest http://www1.ifccfbi.gov/index.asp , which is
the FBI's Internet Fraud Complaint Center. Due to the small amount of
money lost (that's "small" by the law's definition, not mine), you'd
probably have to go to small claims court in Connecticut in order to
have the government intervene. I don't know if you can have a
non-lawyer represent you, and a lawyer would almost certainly cost
most if not all of what you lost. You can also contact www.bbb.org .
This won't help you (more likely than not), but anyone who checks
their website will know that others have had problems with that site.

>
An Internet search of the address yielded:
Berkowitz, Benjamin
239 Front St, Unit B
New Haven, CT 06513
(203) 752-0814

I didn't bother to verify this information.

For the record, I contacted Vernal Elm in October 2003 about ordering a 68060 and recieved three emails in short order telling me that they were in good supply. This was about the time Rodolphe first noted that his order hadn't arrived, so I decided to wait on my purchase. Apparently, that was a good idea.

As I said to Rodolphe in a mail, he might try contacting the FBI,
as this surey constitutes wire fraud, which is a federal offence.

The device I intend to use is coax only.
It's an Art DI/O with a tube driven preamp. It's a relatively simple box with a pair each of audio inputs and outputs, COAX S/PDIF in and out, and a variety of clock signals and sample rates to choose from.
Essentially, it's just an A/D-D/A brick in S/PDIF format.

The DI/O can clock at 44.1, 48, 88.2, 96khz or lock with an external clock...all this is 24bit S/PDIF.
CAF reports that in both the 44.1 and 48 modes, the signals are there respectively, and proper, and seems to sync up just fine in either of these two modes. The right channel is clear as a bell when recording. The left however, is pure static. I find this odd since it's a digital signal all going over the same cable. Strange that the clock signal, and the right channel makes it but the left is nothing but noise.

To be more specific, I can choose FDI Right in the CAF hardware setup, and record a lovely, rich, tube enhanced mono track via whatever is plugged into the right channel of the D/IO. If I select FDI Left, it's nothing but static. If it's a Stereo (any) track...the left side is static, the right side clear as a bell.

Yes, the static is in the CAF monitor....so it's not something that's occuring during the actual recording/sampleing process.

I've been digging in years worth of newsgroup archives and have read something about older SoundPool FDI units that were shipped as 16bit units, and can be upgraded with an inexpensive GAL to 24bit. Could this be the problem? If I can find that GAL I'll certianly give it a try.

I'm also wondering if there are any manuals, software, or drivers that go with the FDI that I should use. I did not get any disks or manuals with the unit, and the CAF manuals only mention the device in passing, without many details. I do have a little program that came with the Studio Son demo package called FDI-INIT.PRG, and I tried this in the auto folder, as well as from the desk top. It didn't change anything. BTW, Studio Son doesn't see the FDI at all...it's simply greyed out...but it could be that it never was implemented in the Demo/Free version to begin with.

With CAF, things work wonderfully the other way around....signals sent to Falcon BUS 1 come through the FDI-DI/O's outputs crystal clear, and that tube warms things up considerably....making the mix much less digitized feeling.

I did indeed test the DI/O, and the cable a couple different ways to ensure it was not malfunctioning.
One can use a coax cable to patch the DI/O's digital half back into itself and use it like a stand alone tube preamp. In this mode both channels and all the cables work perfectly...so that rules out the DI/O or cables being faulty.

> is evrything properly grounded?

As far as I know. All of this kit is on the same grounded circut with correct polarity on all the plugs, and such as that. If any grounding is required besides what's built into the usual cableing, it hasn't been done. Any tips or checks you have to offer and I'll certianly look into it.

> where from do you take clock? DAT or MD?

The DI/O has a selector switch to choose between clocks. This is where I get the signal, from the DI/O itelf.

I did try to get it working in all the various TOS/CT2b modes, with patched and unpatched MROS versions, etc..... and in every instance, it's the same static sound in the FDI left channel. Also been through all the motions of trying it with AHDI, HDDriver, Cecil, etc....just in case there was something going on in that arena.

I'm hoping it's just that GAL update. Anyone know how I can tell if mine is the latest one or not?

Thanks,
Brian

> And there's a lot more out there if you look!!!

But you never see what they actually close out at.
5 hours is a LOT of time in an online auction....
Most bids are settled in the very last seconds.
From my experience anyways....

Also, that's sterling currency. Dollar agaisnt the pound, and shipping across the Atlantic...you can pretty much double, if not triple the cost. I dunno how long it takes, and how hard it is to earn 5punds sterling....but when I import my own british goods myself, it usually ends up being quite a chunk of change ;)

All I'm trying to say is this.
If you need it now, and you want a warranty, and want it in new or fully refurbished condition, $75 isn't all that unreasonable for a ST keyboard....ESP if it's a Mega or TT style.

Did you need reinforcements as well? I've been lifting weights since we met! :) 3 days a week at the gym.

BTW, still have not found an Atari made Falcon 4 Meg RAM board, but I am looking.

Also, a good place to file a complaint is http://www.ifccfbi.gov

I have used it once, and actually got results. It may take time, but when the person at the other end of the complaint gets a call, they tend to become much more responsive.

> some point which may indicate that SCSI would be the better option?

Hi Allan...
If you can find one....
There was a batch or two of Link 97 SCSI hosts done to fit the STe internally.
That's the BEST way to go in my opinion, as this card will do you well with
pretty much any SCSI I or SCSI II device, and it fits neatly inside the MegaSTe
case, and so can your drive. If you later did want to run some external SCSI,
it'd be as easy as using a ribbon cable with your choice of Large or small
Centronics on the far end...with a removeable external terminator pack (or a
simple little toggle switch to enable/disable termination on the internal drive
as needed).

Those are hard boards to find tho.....

Another internal option is Atari's own MegaSTe/STacy host adaptor....
You can likely find one of these just about anywhere that still stocks things
Atari...
Best, ATY, Atari Workshop, Wizztronics, etc....
The catch with this this host, is that AFAIK, it's going to limit you to a 1gig
drive....and you can only connect one device...unless you do a hack job on
it...in which case it will drive two SCSI devices...but that's it. This board
doesn't support parity either! It's a SCSI I host...and doesn't like long
cables at all. This host doesn't generate parity either...so you'll need a
drive that parity can be disabled...or hack in a parity chip (quite a bit of
soldering involved here). Still, all in all, if you shop around, you might get
this host with a compatable drive for a reasonable price, and it'll get the job
done...and would save ya a good bit on casing/power supply/cabling issues.

Next, there are the external options.
These come in a variety of forms and ages....
The best is if you can find a Link 97 or ICD Link II.
These hosts are basically an external cable with some circutry built in, and
they plug into the Hard Disk (ASCI) port of the ST/e.

Both of these will need to get 5v from somewhere (most fixed SCSI drives can
supply this no problem), but both do a good job of supporting a vast array of
SCSI I and II type devices, and either should be
able to deal with larger/more modern drives.

The 'link' hosts are set up for external cabling. So you'll either need to figure a way to loop it back inside your STe's drive bay, or invest in casing and power supply for your 'external' drive.

There are some IDE kits so I hear....I don't know a thing about them....or where they can be found.
Maybe someone else will pipe in with that info.

Finally...there are the old pizza/shoebox options....
Atari's own Megafiles and SH lines....
Various kits built around ICD, SUPRA, etc hosts that mount in the box with your hard drive.
These range from really early ASCI/SCSI/RLL-MFM kits, to pretty modern SCSI I boards. They're getting quite aged and hard to find parts for at a reasonable price....however, if you see a good deal on one somewhere...it's pretty much plug and play ;)

As for drives themselves....
Know what host you're getting and go from there.
Seagate drives are really good about being highly configurable to happily go into just about any SCSI array imaginable...just about anything they make SCSI I or II will work with all the hosts...a majority of the Seagate SCSI III Wide will work with an adaptor as well.

If you want something with removeable media....

All the Syquest SCSI removeables (44, 66, EZ135, Syjet, etc...) should be fine with any of the SCSI hosts you're likely to find.

IOmega Jaz should be fine.

For IOmega SCSI Zip drives, your host must support parity, and keep in mind that this drive has no way of supplying term power to the bus...which means if you have a Link type adaptor, and this is the only drive you connect...you'll need to tap 5v from somewhere to power the Link host. If you can read German and French....the Chips'n'Chips HYP set gives all sorts of tips on hacking Zip drives to be plug and go...as well as various other hacks to make various drives work with various hosts. I don't know the URL for chips'n'chips....but a google search should pull it up right away.

Hope this is helpful,
Brian

7819. Connection HELP Foxinternet

Newsgroup: comp.sys.atari.st
Date: 2003-12-05 00:55:50 UTC
From: Clayton Murray <claytone@foxinternet.com>
Message-ID: <qIQzb.302$ss.10661@bcandid.telisphere.com>
Source record: 22351

Hi all-

Does anyone have their Atari online using foxinternet.com? I've
been using them for over 6 years with both my Atari and
Whine-Doze machines going online without problems. HOWEVER...
foxinternet just upgraded their system (as of 01-Dec), and altho
the PC is fine, my Atari is no longer happy with the setup!
:-(I had to change "login:" to "Login:" to get thru the login
procedure, but now it's having a problem negotiating PPP
connection. Sometimes it IS successful (supposedly), but I'm not
able to do anything at all - check or retrieve email, get
newsgroups, browse. Other times the PPP negotiation times out.

Foxinternet covers most of USA, so I was hoping that someone else
may have gotten things figured out. I'm using Stik II, which has
always worked very well for me. Any help would be greatly
apprectiated, as I much prefer my Atari Falcon for emailing - and
use it for about 90% of all emails, using Newsie.

Thanks very much,

-Clayton Murray
Seattle, WA USA
.

There is a way. But it will cost you. There are SVGA adaptors for ST but
AFAIK do ST Mono only. $50+ if I remember correctly. As far a 8bits you
will need to get a Composite to VGA adaptor, again very expensive.

Better off getting a real Atari ST or Commodore (for 8bits) monitor off
fleaBay.

Tim

I had a similer trouble with Earthlink. A partial solution was to
dial in with a terminal program such as Starcall or FlashII to see what
the login prompts were but the main problem was that their prompt for
username expected "ELN/" in front of my username (found that out in a
conversation with their tech guy at 3am). Hope that something similer is
all you need!

John

no, nothing out of the way was said (yet). I was going to proceed
further for clarification purposes but maby that would have been too to
close to Ctirad's circuit!
Is the Falcon Service Manual different from the Service Guide? If so,
and you have an extra one to sell let me know! Also, I could use a list of
corrections to errors in the schematics and some missing data in the guide
(like Vcc and ground pins on some IC's).

Hmmm. I sell the ST to SVGA adaptors, with sound, for £15 GBP, = about $40
inc shipping.

SVGA will only do hi res mono. You need a multisync monitor for colour.

> Better off getting a real Atari ST or Commodore (for 8bits) monitor off
> eBay.

Remember all the Atari monitors have production dates on them, all are now
over 10 yrs old.

For colour maybe buy an Atari SC 1224, 1435 or the Philips / Commodore
monitors.

For hi res mono a recent 15"- 17" SVGA is by far the better buy.

Has anyone tried to use an IDE Flash Drives in a Falcon? I'm thinking of replacing the measly 65MB drive in my Falcon and would it seems like a flash drive would be a great idea, if it worked. It would be quite, fast and have no moving parts.

I am implementing a Compact Flash II as IDE device in a STE. You should
be aware of the fact that such devices do not stand more than about 500
000 write cycles (maybe more now). This should not be a big deal except
if one is used to defrag its hard disk every day !

you can have a glance here : http://stlabs.free.fr/

there exist loads of IDE-CF adaptors including the reduced form factor
of the IDE connector like in the Falcon :
http://www.acscontrol.com/Merchant2/merchant.mv?Screen=PROD&Store_Code=ACS&Product_Code=ACS-CF-IDEToCFA-SFF&Category_Code=COMPACT_FLASH

as long as it is 2.5" IDE drive not bigger than 6 or 8 Gb (since TOS can't "see" partitions after P...) it should work...
I use Toshiba 6 Gb drive which works reather fine...3.5" IDE drives should also work but then it would be good idea to recase the Falcon to PC tower...

I noticed that when set to 500/500 there is almost constant saving to
the hard drive when downloading (with CAB). So I have it set to 100/100
getting an access at about 250k worth of download (less wear on the hd).

Hi all,
does any one know if it is possible to connect a parallel Zip drive to a
ST/STE? If this hasn't happened is it because of technical reasons that make
it hard or impossible to write a driver?

Thanks

7838. Re: Parallel ZIP drive on ST/STE

Source record: 22370

There is a hack on Aminet (for Amigas) to allow Amigas to run a parallel zip drive even though the Amiga suffers the same shortcomings as the ST in the parallel port configuration. The hack utilizes extra lines through a second cord running into the joystick port. I'm surprised that some enterprising ST'er hasn't created an Atari version of that hack to allow for parallel zip drives on the ST.

I had this trouble before when I was doing dial-up. To fix it I
logged on using a regular dialing telcom program like StarCall. I
looked at what the site was asking for and then adjusted my sign
on procedure accordingly. Worked fine after that...

Well I bought the Commodore monitor cable from B&C for 8-bit XL/XE
sytems and then bought a video converter. I was able to run my
XL/XE computers on my SVA Compaq monitor. Looked great. For my STe
I bought an old piece of hardware called Video Key and was able to
hook it up to my Compaq monitor using (again) a video converter.

For sound, I able to hook up a speaker using the black wire of the
Commodore 8-bit cable. On the STe, the Video Key has audio jacks
that allowed me to hook up speakers.

Hello,it's possible to connect a parallel zip but you must ave the interface
make by woller system:http:www.woller.com.
its a cartouche =>parallel interface white some prg in auto folder to can see
the cartouche drive y ave this, but y don't ave the zip parallel.
y hope this can help you
A+

Note that the figures are in _sectors_. The largest sector size here is
16384 bytes (largest partition is 1 MByte) so 100 equals 1.6 MByte cache.
Quite a lot!

If I use "delayed write" of HD cache will Magic try to write this data
when it crasches badly ("System angehalten")?

Will these adaptors provide a black&white display? I have an adaptor here
that gave sort of black&green but it could be faulty.

>Kwanzaa. You bastard.

Wrong! Christmas is not a religious only event. Where I live we have
selebrated this event long before christianity came here (around year
1000). The Swedish word for christmas is still the older "jul" and Santa
Claus goes under the name "jul-tomte". The "tomte" is a clearly non/pre
christian folk tradition being.

I would say the same is basically valid for all Germanic countries and
possibly also the Brittish Isles. Don't know about about the former Roman
empire, though...

I talked the matter of Ramadan over with a Persian guy the other day.
Apperently he does not celebrate Ramadan as he is not a performing muslim.

Incidently people who write/say stupid things are in Swedish often called
a "tomte", often with the the christian influenced word "djï¿½vla"
(devil/bastard) put in front. Makes me wonder if you could be called a
"djï¿½vla tomte" :-)

All the SVGAs I have tested gave a monochrome picture.

Is your monitor a green screen or is the adaptor an old monochrome version?

Might be, I have not opened it. I don't have it right here now either.

It should just be a matter of soldering the colour pins together, I
guess. Or do your adaptors have resistors built in?

Great!

Is this actually the English version and with full English documentation?

While looking at http://www.rom-logicware.com/ it looks like PapyrusX is
only in German for any platform.

7855. AV_SERVER/fontselector

Newsgroup: comp.sys.atari.st
Date: 2003-12-06 23:24:50 UTC
From: d.w.vanderburg@student.tudelft.nl
Message-ID: <1e582fb0.0312061524.6c3a2963@posting.google.com>
Source record: 22385

Hi,

does anyone perhaps know a good software that acts as an AV_SERVER,
and a fontselector program? I would like to use such programs in
combination with XaAES/ TeraDesk or Atari AES4.1/Atari MultiTOS
desktop, which do not provide such services by themselves.

Also I'm looking for a program that can place a picture in the
background of the desktop of e.g. TeraDesk or the MultiTOS desktop ...
I know a program DeskPic2 that does exactly this task but only works
well with single TOS.

kind regards,
Dennis

7856. Atari Items for Sale

I have a fair bit of kit to sell - Significant Other requires the house to be tidied of the kit I have accumulated over the years...

If you are interested in any of this, please drop me an email on the username denesh within the domain name in the header of this message. There is a lot more stuff apart from that listed below - I will point you to a link on one of my web sites that contains the full lists... CDs, DVDs, VCDs, Videos, Cassettes, Beanie babies, Household/Kitchen electricals, etc. All this needs to be sold before Christmas.. I am pretty much open to decent offers. :)

Some of this includes Atari kit as follows:

Accessories: Lion 320VC Hard Drive Enclosure (2 hard drives, set up for SCSI, Used with Atari)
Atari: Imagecopy 4
Atari: Jinnee
Atari: MagiCPC v1.2 with Ease
Atari: NVDI v5
Atari: Timeworks Publisher 2

Other items include (but not limited to):

Accessories: 2 Large 3.5"" Floppy Disk boxes
Book: AIX Version 4 System and Administration Guide : James Deroest
Book: Red Hat Linux 6 Inc Large RedHat Manual
Camera: Sony Ericsson CommuniCam MCA-20 Mobile Phone Camera
Camera: Sony USB Webcam Xtra Kit CMR-PC2
Computer: PIII 450MHz, 128MB RAM, DVD, Ethernet, Modem, Mini Tower
Gaming: GBA - Translucent Gameboy Advance
Gaming: GBA Carry Case
Gaming: GBA Gradius Advance (Game)
Gaming: GBA Light
Gaming: GBA Multi-Link
Gaming: GBA Namcomuseum (5 Games - Galaxian, MS Pac Man, Dig Dug, Galaga, Pole Position)
Gaming: GBA Power Adapter
Gaming: GBA Super Mario Advance (2 Games - Super Mario Bros 2, Mario Bros)
Imaging: Olympus Camedia P-150E Photo Printer
Monitor: HP 12"" Mono Monitor
Music Player: Hitachi 3D Bass Superwoofer Twin Drive Stereo Surround System
Music Player: Sony Minidisc Walkman -MZ-R30
Music Player: Sony MP3 Walkman - NW-MS7
PC card: Nokia GSM Data PCMCIA Card v2.0 (Orange network)
PCI card: D-Link DWL-520 Wireless PCI Adapter
PDA: Cassiopeia EM-500
PDA: HP Jornada 690

PDA: Palm V Communications Kit (Modem)
PDA: Palm V Louis Vuitton Leather Case
PDA: Palm Vx (Broken Screen)
Phone: Sony Ericsson T68i (slightly faulty)
Router: 2 Farallon Netopia ISDN Routers
Software: Applixware for Linux
Software: BeOS Release 4
Software: Redhat Linux 7.1 Deluxe

Regards
Denesh

7857. Re: AV_SERVER/fontselector

On 6 Dec 2003 15:24:50 -0800, Dennis van der Burg <d.w.vanderburg@student.tudelft.nl> had a noticeable pleasure while writting:
> does anyone perhaps know a good software that acts as an AV_SERVER,
> and a fontselector program? I would like to use such programs in
> combination with XaAES/ TeraDesk or Atari AES4.1/Atari MultiTOS
> desktop, which do not provide such services by themselves.

Thing does that, but it is full desktop program.

> Also I'm looking for a program that can place a picture in the
> background of the desktop of e.g. TeraDesk or the MultiTOS desktop ...
> I know a program DeskPic2 that does exactly this task but only works
> well with single TOS.

DeskPic2 hacks TOS to do it. The proper way is to implement it directly into Desktop. As Henk to do it and I think he will do it.

I've thought about it too, and still might go that route someday.
Here is a link for an ICD to CF adapter. Just add a CF card and off
you (should) go. http://store.mini-box.com/ituner/cfdisk2d.html

Thing does it. Both act asa AV_SERVER and FontSelector, also support
dragfont etc.. Thing is a good choice.

7863. Atari Falcon SCSI Issues?

Newsgroup: comp.sys.atari.st
Date: 2003-12-07 14:36:35 UTC
From: JagCube@yahoo.com
Message-ID: <83fbea98.0312070636.37b780f3@posting.google.com>
Source record: 22393

I have a Falcon 030 (stock) with 14MB RAM
and an external Yamaha CD-RW.

Using MiNT/MultiTos, TOS ROMS 4.02, 63MB IDE (internal) HD, 68882
FPU....
I was messing around with ACE from New Beat Software... and I couldn't
get it to load properly under MiNT.(it would freeze) so I tried it
just in straight TOS and it loads only with a orange background and
everythings messed up looking (well, its hard to see with the orange)
and
doesn't seem right.

I unhooked my SCSI CD drive and wham, it works just fine in MiNT....
now... is this a serious issue? I know I've read and heard about scsi
/ audio related
issues but what can I do?

Thanks for any tips, tricks and advice!

In the good 'ol US of A? Heck Yes. And they go for even higher i'm
afraid!! I paid $320 for my Falcon030 last April. Subsequent units went
for $400 or more after that. I guess the Falcon and TT/MegaSTe's are a hot
commodity here in the US. Either that or us Americans sure have a lot of
expendable income! LOL

Too bad people didn't feel like that back when they were actually first
released. Maybe Atari would of lasted longer if people bought more machines
and software.

I use a IDE interface from www.keychange.co.uk with a 2.5" drive show horned
in behind the RAM.
It appears from inspecting the machines internals that you need to remove
one of the plastic posts to fit it in
and I think the cover over the RAM, but it works well. I can't remember how
big the drive is, but it not big.
I think I would find it hard to fill a big drive, and smaller 2.5 are often
cheap from folks who have upgraded lap tops.

Not sure what the status of the Mario Beecroft interface is. That also looks
good but does not seeem to be
available any more.

If you are going SCSI then you will need an ASCI to SCSI converter. I would
look for one with Parity
as many things like it. However if its an early STE then you may need to
change the DMA chip as some
don't work with some SCSI adaptors. I think the duff version is labeled
CO25913-38 but its under the floppy and its hard to check the version.
Search the group archives at groups.google.com for more info.

> May be a second hand unit could be the go?
>

If you want SCSI you will almost certainly need to go used. I don't think
there are any adaptors in production.
Don't expect this to be very cheap. There a lot more ST and STE computers
than hard drive interfaces.

7871. External SCSI Cabs - Free to any one who will collect

Newsgroup: comp.sys.atari.st
Date: 2003-12-07 22:45:00 UTC
From: David Wade <g8mqw@yahoo.com>
Message-ID: <br0ahd$26ud0k$1@ID-40235.news.uni-berlin.de>
Source record: 22251

Folks,

I have three DEC storage expansion units of similar appearance, cream coloured, about the size of a desktop PC case and each with PSU, two external SCSI connectors.

I acquired them to use on my Atari collection but I seldom use them now, and I
really need the space. So they are free to any one who is prepared to collect them
from the south Manchester area. They bear the model numbers :-

SZ12J-JB, RZ5X and SZ12G-XB

They each contain one or two SCSI drives, I think about 600 meg, but they are odd
digital drives and probably won't work on the ST as they need the drive to be "poked" to start it.

However they would make good cases for disk drives, CD ROMs or Tapes.

As it says in the title they are free to any one who will collect.

I will try and remember to check here, but will also accept e-mails to my hotmail.com account which is g4ugm. Don't use the YAHOO account. It fills with SPAM faster than I can read it.

Dave.

> released. Maybe Atari would of lasted longer if people bought more machines
> and software.

Speaking for myself....and I'm sure alot of others like me....
I grew up with glorious trade magazines of the late 80's and early 90's...when all this stuff was a fad in high gear production. It inspired me, and shaped so many of my current interests. I knew CuBase backwards and forwards years before I could ever afford my own. The problem was, I was just a kid, with no money, and no income. Now that the people who grew up dreaming of owning and using some of this stuff have some income to spend on it....ya can't find it, and no one wants to service it. Kind of ironic isn't it?

This isn't just with Atari stuff....
An engineer friend of mine that works for Peavey made a comment once after a week of working his turn at coustomer support. "Damn! Back when we were producing this stuff, we couldn't give it away...now everyone wants the old 'junk'."

I chuckled at him and said, "Hey...$40.00 a pop to ship out new manuals for 12 year old products changing hands on ebay....I doubt you have many products 'in production' with that kind of profit margin ;) If I were Peavey, instead of complaining about fielding service calls on older equipment....I'd be printing up old manuals and smiling all the way to the bank!

Well hello! Your prospective markets are just NOW coming of age in the pocket book...duuuuu.

While it's true there's likely a newer and better gadgets for the taking....there's something to be said for a connection between sentiment, famaliarness, and heart-set.

So here's a thought for you marketing people out there. Whatever widgets and thingabobs you manage to gather the resources to make a reality....you should stash a batch or two away in a warehouse somewhere and wait 10 to 15 years. By then...the kids who actually read all your propaganda in the dreamer's magazines will be men and women with some control over their own purse strings...and you can charge an arm and a leg for the stuff be amazed at how many will actually buy it with a smile :)

Such is life...
Brian

For what it's worth, My external SCSI Yamaha CD/RW drive was fine until I switched the ID from 4 to 2. Then Extendos had it "greyed out" and not configurable. So I'm not sure if there's a problem on my Falcon's end or the switch on the drive for "2" but if I'm not mistaken, Anodyne's site suggests "5" for R/W drives.

Amazing, I posted it three times in this group and still people are
convinced of the wrong answer. *YES* you can link a parallel ZIP-drive
to an Atari, using a special cartridge-port adapter. But that adapter
might be hard to find. :)

(Actually, last time I posted this, a few weeks ago, someone replied
with the company that sold the adapter.. look it up and ask them) :)

> issues but what can I do?

Opens can of worms..... OK, your first port of call is your hard disk driver. What are you using ICD, Hddriver, AHDI or CBHD? Next up it could be the infamous scsi bug. Being that you are running TOS 4.02 it would be a pretty safe bet that you are running an early Falcon. So the SCSI buffer mod comes to mind. Have you ever had any SCSI issues before? Next you could try booting with no accesories or auto prgs. Lots more to try ;-)

http://auctions.shopping.yahoo.com/auction/83162193

The Supra 20MB disk drive can store loads of the relatively tightly coded Atari ST programs. The access time is of course MUCH faster than floppy drives. Supra makes quality products and this external Atari ST drive could be just what you are looking for! Only 2 hours left but check out all the auctions as I am listing my Atari 520STFM w monitor and another 30MB Supra hard drive.
http://auctions.shopping.yahoo.com/auction/83162193

ALL THE AUCTIONS
http://user.auctions.shopping.yahoo.com/user/essoterik2001

All Yahoo Auctions are selling for VERY cheap (relative to eBay auctions), so you can pick up a great deal!

The ram cover remains.

If I have sufficient orders I can procur another batch of the ide
interfaces.

I have one complete STE fitted with the IDEal interface and a new 4gb drive.

Offers?

I also have a small stock of Link 97s.

For larger drives, once you've run out of partition letters, you can use
something like EXT2 or MINIX to make really large partitions. Of course these
particular partitions are only gonna work under MiNT, but they do work ;)

7889. Falcon Monitors ??

Newsgroup: comp.sys.atari.st
Date: 2003-12-08 20:40:57 UTC
From: Meffy <methanoid_AT_@hotmail.com>
Message-ID: <r6o9tv0p4kdduu9qkpsv4r7ies20g5ffac@4ax.com>
Source record: 22268

As a Falcon newbie I am wondering...

Which monitors I would need and which connectors?

I have a PC TFT monitor and TV but do I need two monitors and some sorta switch box?

Just wondering if I would be able to use VGA modes and play Falcon games AND ST games using Backward?

Also, wondering where one gets Falc software - most ST software is available via places like LGD but is there such a place for Falcons?

Thanks for any help.

does anyone know how I can wire a TT keyboard cable to a Falcon
keyboard connector....

Managed to get one of those PC kb/mouse and Joy/Mouse adaptor kits but
it was wired for a Mega/TT and not Falc/STE

thanks for any info

7891. Christmas treat for Atarians

Newsgroup: comp.sys.atari.st
Date: 2003-12-09 05:58:11 UTC
From: M_Olin@yahoo.com
Message-ID: <6a511e27.0312082158.77a75aaf@posting.google.com>
Source record: 22270

Greetings. This is your blast from the past. I used to help maintain the Atari Archives at umich, so perhaps some of the survivors from the '80s and '90s will remember.

I would like to post my annual Christmas Message, and also to wish everyone who ever owned an Atari to have a safe and happy holiday!

Atari and Caramel Corn:
Something good from the '80s

At least a decade ago, a small company wrote and released a program that would eventually evolve into a popular desktop publishing package for the Atari ST platform. Originally released as "Publishing Partner", the program later became known as "PageStream".

The original program, or one of its early updates, included some sample documents which demonstrated the program's uses and features. One of those sample documents was a recipe for caramel corn (!) which was not only a supremely tasty treat, it was exceptionally easy to make (no thermometer! no dropping glops of sugary goo into water!) and it was "goof proof". I no longer have the program or the original document file, but to this day I still make the caramel corn treat every year at Christmas.

So that no one need go another Christmas season without this neato treat, I am posting it here for your pleasure.

Enjoy!

Atari Caramel Corn

Utensils:

Large saucepan, cup and spoon measures, long-handled wooden spoon, 2 cookie sheets or cake pans with at least 1" sides, paper grocery bag.

Ingredients:

6 quarts popcorn (1 cup unpopped corn)
1 cup butter
2 cups firmly packed light brown sugar
1/2 cup light corn syrup

1 teaspoon salt
1/2 teaspoon baking soda
1 teaspoon vanilla
spray cooking oil

Pop corn in advance, using as little oil as possible. If you have an air-popper, so much the better. Set aside.

In a large saucepan, stir in brown sugar, corn syrup, salt and butter. Bring to a good rolling boil, stirring constantly. Reduce heat to medium and continue boiling without stirring for 5 minutes.

While mixture is boiling, lightly treat the inside of a paper grocery bag with spray oil. Place popped corn in bag. Treat the two cooking sheets lightly with spray oil.

Remove candy mixture from heat, stir in baking soda and vanilla. (CAUTION: adding vanilla will likely cause some splattering, be very careful!) Make sure the mixture is completely stirred as the soda tends to avoid the lower edges of the pan. Pour mixture over popped corn and mix gently with a wooden spoon.

Roll the top of the paper bag and place in microwave oven, preferably on a microwave-safe surface, NOT on metal rack. Nuke for two minutes, and then stir the popcorn again. (WATCH FOR STEAM WHEN YOU OPEN BAG!) Repeat this procedure twice more, nuking for 1-minute intervals until corn is completely coated. Variant: you may add some redskin peanuts during the last stir, but DO NOT microwave peanuts as they can add an unsavory smokey flavor to the corn.

Pour candied corn equally onto cooking sheets. As the corn cools, continue to stir to prevent clumping. Variant: I've never done this, but you could probably form corn into popcorn balls.

That's it! You've just made yourself a batch of Atari Caramel Corn!

The original Publishing Partner recipe called for using a warm oven instead of a microwave to keep candy hot for stirring/coating the popcorn. It was convoluted and took approximately an hour. The microwave is much faster and easier and makes no noticeable difference in the final product. (You'd have to be a Windoze user to ruin this treat!)

--
M_Olin@Yahoo.com
The recipe above is certified Y2K compliant.

>
> I have a PC TFT monitor and TV but do I need two monitors and some
> sorta switch box?

You will need an Falcon to VGA adaptor for use with a Standard or TFT
PC monitor and you can run all standard Falcon and ST screen modes on
it, if you also want to run it on a TV then try a Falcon to VGA
adaptor with RGB switch although not having seen or used the latter I
cannot vouch for it effectiveness.
You should be able to purchase these from any good Atari retailer for
example B & C in the US (www.myatari.com) or Atari Workshop in the UK
(www.atari-workshop.co.uk) among others.

> Just wondering if I would be able to use VGA modes and play Falcon
> games AND ST games using Backward?

Most Falcon games will run in an appropriate Falcon screen resolution
using either 260 or True Colour however you should be aware that games
sometimes ignor the internal speaker volume setting and play sound at
full blast from the internal speaker, espically those that load
directly from floppy so you might want to think about disconnecting
the internal speaker and using PC speakers via the headhone jack.
I know that Crown of Creation 3D does this even when run from the Hard
Drive until it reaches a certain part of the game then it acceses and
uses it's own volume settings, strangely it also only diverts some
sounds to the internal speaker for exapamle all non flight mode sounds
go to the internal speaker but all sounds are sent to the headpone
socket only while actually flying the missions so watch out for that
of you ever get a copy.

Personally I've never managed to get Backward to work so if you want
to play ST games without purchasing an ST you would probably be better
off using a PC and an emulator like STeem.

> Also, wondering where one gets Falc software - most ST software is
> available via places like LGD but is there such a place for Falcons?

Again any good Atari retailer will probably stock them (eg. B & C or
16/32 Systems) or look out for people selling stuff either here for on
an Atari related forum such as Atari Age (www.atariage.com) among
others.

Hi!

l> I tried a 128mb and 256mb SanDisk IDE flash drives in my hades, with no
l> success. It just would not see the drives correctly as master or
l> slave. I ended up reselling them on ebay.

Has anyone tried PreTech IDE flash drives (SAH05, 2.5")?

Flash drives use more logic to hide the flash chips going bad than
CF-cards, thus I'd prefer such a device to a simple
CF-card-to-IDE-adaptor. Anyone experience with the latter?

I plan to replace the STBook internal HD, so it should cope with a
moderate but steady (re)writing of sectors.

Regards,

Alexander

TFT displays are designed so that their pixels are the perfect size for one
particular resolution, which on 17 inchers is 1024x768 usually. Any lower
resolution will look horrible and be far better looking on a CRT monitor.

Hi,

I am cleaning out stuff preparing for a move. I have the following ST items that I'd like to see go to a good home (rather than the trash, where they would end up if I gave them to a thrift):

* Atari SM124 Monitor (b&w, data cable [incl.], uses std. power [not incl.])
* Atari SF354 3.5" Disk Drive (including i/o and power cables)
* Atari 520ST Computer (not working, first time I powered it I got a bomb, no display after power on after that, tried reseating chips, didn't help)
* Atari 520ST power supply

No software is included as I don't have any.

Send me your best offers. Keep in mind shipping charges will be added on top, as these items are quite heavy. I live in Tucson, AZ (ZIP 85710)

Please E-mail any offers to jeffryjohnston@yahoo.com

Thanks,
Jeffry Johnston

7900. What's the best way to hook up a HD to a Stacy?

I'm asking the same question(s).
Atari made a SCSI host for internal fitting to the STacy and Mega STe (CIO3561-001). This host unmodified is limited to somewhere around 1 gig, and it does not support parity. Unmodified, this host only allows you to hook up one SCSI device. You can likely find this host without much fuss if you call around to various Atari suppliers. I understand this host can be hacked to support parity. I also understand it is possible to hack the host, and the cable to control a second SCSI device.

I have one I'd like hacked...I just don't have the guts to try it myself. So far...all the Atari shops I know of don't return my emails when I ask if they'll do the hack...or they flat out refuse.

Another internal option...IF you can find it....
There was a Link 97 internal made for the STacy and Mega STe. So far, I haven't been able to find one. This is a full Link 97 SCSI II host...up to 7 devices as I understand it. Larger drives...anything SCSI I, II, or III, arbitration supported, etc.....but finding one isn't so easy.

I've asked here on the news groups if any of the IDE interfaces will work in a STacy as in internal option...no answer yet but I'm sure it'll come around.

The STacy also has the ASCI interface. Key Exchange still has a few Link 97 cables in stock. This'll be an external option of course.

Brian

7904. Re: Battery for STacy?

Newsgroup: comp.sys.atari.st
Date: 2003-12-10 01:03:02 UTC
From: Alexander Beuscher <alexb@feanor.schunter.etc.tu-bs.de>
Message-ID: <Pine.LNX.4.58.0312100153160.5449@feanor.schunter.etc.tu-bs.de>
Source record: 22283

The STacy needs too much current so that battery packs won't allow for more than about half an hour of unplugged computing.

But it's quiet common to put the external PSU in the battery hole. For this solution you have to cut out some pieces of the STacy case and remove the PSU's case.

Regards,

Alexander

7905. Help w/SoundPool FDI

Newsgroup: comp.sys.atari.st

Message-ID: <imuBb.589$Y83.73@bignews2.bellsouth.net>
Source record: 22284

I got a Stienberg-SoundPool FDI in a box of auction goods.
No disk or manual...
I'm hoping someone might be kind enough to email the utilities, as it seems I need some sort of FDI initilzation utilty, and I don't have it.

With CAF, I can keep tinkering with things and eventually get it playing. As for recording, I can only get the right channel working...the left is nothing but static. The S/PDIF device I'm using is an ART D/IO that's fully tested and working with other S/PDIF systems.

Yes, I did contact SoundPool...I got some help but not what I need, I'm still waiting for more advice...possibly whatever software it is I need, but no answer yet.

I did find something called FDI-INIT.PRG in a demo Studio Son version, but it did nothing of noteable value. Studio Son doesn't see the FDI at all.

If someone will email included FDI utilities, I'd be greatful.

Thanks,
Brian

> The STacy also has the ASCI interface.

Keychange, www.keychange.co.uk still has a few Link 97 cables in stock.

This'll be an external option of course.

The external is the better choice, simply because if you don't have your
data backed up and the STacy or whatever fails you can't access your data
'till you get the machine fixed. You can just plug your external into your
spare ST and continue.

The IDEal IDE interface is designed to work on the square 68000 processor,
as in the STE.

> interface sounds interesting.

Still it's prolly better to find a cheap second-hand scsi zip drive..
much faster. :)

> Would it be possible to boot from this setup? (probably wishful thinking!)

I don't see why not, but then again I can't be sure.. never saw it in
use, I just know it exists. :)

> Also Bill made reference to a company that supplies the adaptor does any one
> know who that is?

I just googled for it and it appears to be by Woller (www.woller.com)
but I can't find it mentioned on their website now. But maybe you can
contact them and find out. :) If they don't sell it anymore, you might
find one second hand..

Oh and I heard "Woller systeme is dead" several times and every time I
hear that, their website gets updated. :)

Good luck,

Maurits.

7918. MUP 4.6 Music Publisher for Atari FreeMiNT

Newsgroup: comp.sys.atari.st
Date: 2003-12-11 12:03:40 UTC
From: Martin Tarenskeen <nospam@zonnet.nl>
Message-ID: <Pine.MNT.4.31.0312111302150.350-100000@UNI_MANiac>
Source record: 22198

Hi,

Now also available as SpareMiNT RPM package for Atari FreeMiNT !

MUP (Music Publisher) version 4.6 from Arkkra Enterprises (
http://www.arkkra.com) is a shareware Music Typesetting program that can
also output standard MIDI files.

The SpareMiNT RPM packages can be found here:

http://www.home.zonnet.nl/m.tarenskeen/download/mint/

Download from there the following packages:

mup-4.6-0.m68kmint.rpm
mup-docs-4.6-0.m68kmint.rpm

I compiled mup with -m68020-60, so you need at least a 68020 and an FPU
for this version.

If you have such hardware and have installed FreeMiNT I can highly
recommend this software. Give it a serious try.

Hi!

FP> I am implementing a Compact Flash II as IDE device in a STE. You
FP> should be aware of the fact that such devices do not stand more than
FP> about 500 000 write cycles (maybe more now). This should not be a big
FP> deal except if one is used to defrag its hard disk every day !

The point is that FAT sectors are written to quiet often (whenever a new file is created or whenever an existing file is growing over a cluster border), thus they will get damaged first - although other sectors may even be untouched until then.

One could think of an alternative way of partitioning, placing the FAT sectors not directly at sector 2.

Or use an alternative file system (minix, ext2) with better distribution of administrative data blocks.

Regards,

Alexander

Hello all,

I just wanted to sghare my experience with other CT60 and CT2 users who experience dancing pixels and disturbances when clocking Videl with 50 or more Mhz...
First of all, it ise necessary to use 60 ns SIMMs and good STRAM card...
However, I used both, but there were many dancing pixels which stayed...
I accidentaly found out that Videl (i don't know the exact type if there are several versions of the chip...) in my Falcon with CT60 was pretty hot when clocked so I decided to stick a cooler witha fan on top of it with thermal glue...So, after sti
cking AMD Athlon 1.4 cooler :D the Videl was cooled down and the dancing pixels dissapeared!!
I didn't notice any disturbances on the screen since then...
It is easy to do it especially if you don't have internal hdd inside Falcon, but if you do you can also do it...
I did this w ith dsp too, although one capacitor had to be displaced a bit :)
So everything is cool and working perfectly now :)

have fun!

Hi All (and Uwe),
Regarding HDDriver FAT/Data cache settings is it normal for a setting of
100/100 to eat up 3.5 meg of RAM? It's 355k with 10/10.

You can calculate this by multiplying the number of buffers (200 in your
case) with the size of the biggest logical sector on your drive.
So the memory needed depends on your partition sizes, and that's why it
is impossible to give general recommendations on the best settings.

Well, attempted that I read Rodolphe's docs correctly, he just
recommends cooling the videl with buses faster than 40 MHz ;-)

Hi Uwe,
How does the sector size get set for hard drive partitions? I see only
choices under "Removable Media".

How does this set up look regarding efficiency and proper HDDriver
configuration? You mentioned that the FAT/Data cache default is 100/100
That eats up almost 3.5meg RAM. Is 20/50 with 999 folders ok for proper
driver usage?

Falcon, Tos 4.04, No Magic, etc.
Partition Info: 512 bytes per sect. 512 in root dir.
# of partitions: 12 + 2 CD drives = 14 total
Partion Sizes: 70meg to 994.9meg (all GEM)
General: 20/50/999 (RAM used: 1214 kb)
SCSI Driver: All but Link97 x'ed
Rem. Media: No x's, min. part. = 1, Max sect. size = 16384, Actual = 16384
Devices and partitions: No IDE, 1.1, 1.2, 1.3, 1.4, 1.7

IMHO this is not very intuitive for the average user, kB would be
better!

So perhaps it could be calculated automatically by HD-Driver
configuration program? One could set the cache size whether in kbytes
(default) or in sectors, and a switch between the two units would be
available. If a amount in kbytes (say 17kB) would not convert to an
exact amount of (say 16k-large) sectors, an alert box would be
displayed explaining that a rounding has occured.

Just a suggestion anyway!

This is great. I would love to upgrade from version 8. Do I have to send in my disks/manual or will a scan of my disks suffice? I live in the US, so what is the current convert from from EURO to US DOLLARS? It will be nice to have version X The demo loads alot faster on my Hades than version 8 and it does not crash.

Sounds good. I will have to order an adapter. I was looking for
one for my STe.

7942. Help! CT60, screwed up boot resolution (dumb ass user!)

Newsgroup: comp.sys.atari.st
Date: 2003-12-13 14:21:25 UTC
From: wmartz@firstpresdalton.org
Message-ID: <2f399fc7.0312130621.3d6618ae@posting.google.com>
Source record: 22224

I have a Falcon, CT60. The Falcon has no tv out port. It was working fine, but while playing with the CT60 config CPX, I tried to set the boot resolution higher. I must have hit the wrong button. I've been testing with 2 different moniters. One is a flat panel from my Dell that I was testing with, since it was easier to move back and forth. Booting in 060 mode on the flat panel, I briefly see the "Pretty" screen, then it goes black. I think the falcon is continuing to boot normaly, since I hear the hd start after a typical amount of time for the ram check, or I hear the hd start as soon as I abort the ram check. Of course, I'm guessing, since I can't see anything. I never see the fugi, or the rest. So far, I'd only put on HDDriver, extendos and NVDI. I also have a normal 17 inch moniter that I use with my CT2B falcon. I tried with it. It is slow to warm up the screen, so when booting with it, I never see the "pretty" screen, but I think it is acting the same, since the little green light that comes on when things are working normally comes on for a second when booting in 060 mode. I have 2 different vga adaptors. When using the Atari adaptor, booting in 030 mode, on the 17 inch I get mostly white jagged lines across the screen that pulse on and off about 3 times per second. Same setup, in 060 mode I get white jaggies, spaced further apart, pulsing slower, about 1-2 times per second. With the dell moniter, no jaggies, just black. I posted on the DH site, where I was told that if I hold down the shift-alt-undo key, it will reset the falcon to factory settings. This is a bit hard for me to do, since I've recased this Falcon in a Wizztronics case with a DEKA keyboard adaptor. I only have a ps/2 keyboard, and the undo key isn't mapped properly. I tried 1 time to install the atari keyboard so I could do the control-alt-undo thing, but nothing different happend. (I have to move the power supply to plug in the keyboard.)
So, I think I set the falcon to some incompatable mode for a VGA, perhaps tv? (no tv out, can't tell!) How exactly can I reset it to the "normal" boot resolution? If there is a particular key combination to hold down, does it happen at a particulat point in the boot process? (If so, I'll have to guess, since I can't see where it is in that process.) Am I the dumbest assed Atari user you have ever seen post here? (I guess you don't really have to answer that, but go ahead if you must!)

Actually the _driver_ tells how much RAM will be used on boot already.
The HD Driver configuration utility program can't know the amount in
kByte. Depends on which partitions are found when booting if I understand
it correctly.

I use 10/10 (which happens to be the default, not 100/100!) and it works
well with 4 HD's and a CD. Max partition size is 1 GByte.

Test with 10/10 and if you don't get any performance loss keep it that
way. If not incrase the buffers. Quite simple, actually

If it works in 030 mode, what you want to do is.
A: download TOS 0.99g from aniplay.atari.org if you don't have it.
If you do, you're screwed ;-)

B: update the tos with the flash tool.

THEN do the control-alt-undo.

Without tos .99g it wont' be clearing the flash of the ct60 which overrides tos nvram probably.

A good flash card will track sector usage and allocate another one if it's getting near it's limit. A few million writes for certain sectors should not be a problem for a good card.

Beware read the Manufacturers data sheet as the cheap cards don't seem to bother.

Dave

500 000 is five hundred thousands i.e half a million !

I just had a short look to some CF specifications: some are given for
300 000 write/erase cycles, some for 500 000, and some others for one
million.

Cheers
F.

Hi Kenneth,
I had it at 10/10 but changed it to 100/100 (I believe Uwe said it was
the default) but noticed that programs (Newsie, for instance) took longer
to load at 100/100 so it's at 20/20 now. I'll play around a bit with it but
not for long :)

John

Message-ID: <1071392352-454763AEicMi@adelphia.net>
Source record: 22236

Wayne,
Have you tried unplugging the CT60 from the Falcon
all together??? This may make it possible to go into
the CPX and change the settings since it will not see
the CT60 at all and use NVRAM settings. Also one
other thing, this happened to me once with my Falcon
when I first got it. It was a setting inside of NVRAM
but the way I got around it was messing with the VGA
monitor settings so that I could just barely see the
picture. I forget what settings I messed around with
but the picture was so light I could barely make out
any text. But it was enough to make the nesecarry
changes and reboot and everything was OK. My monitor
settings were completely screwed up but at least I
could see the screen to readjust the settings at that
point. Try this and let us know what happens. Do you
have your Falcon MOBO accellerated as well???

Thanks,
Carey Christenson

You could sell it to me perhaps? ;-) Seriously One possible solution would be to get a falcon RGB adapter and an atari SC1224 monitor and hook it up and see what happens. If you run out of software solutions completely this could be your only way. I suspect your falcon vga adapter (which sounds homemade) is bugged somehow and tells the computer that it's RGB or something.

If you're in the US, I have an ST-mono monitor you could use to take care of the issue too, but I don't have the falcon RGB adapter for you to borrow.

Also to note others who say switching overscan mode on vga is impossible? I think I did it the other day. At least the button depressed and I unselected it because I know overscan is not possible on vga.

You could always whip up a RCA adaptor to get Composite output and hook it up to your TV. I forget the two pins that are needed but if you email me I can look it up. I hooked mine up once to my TV this way.

7958. Large File Copy Problem!

Newsgroup: comp.sys.atari.st
Date: 2003-12-14 22:43:43 UTC
From: swamptaxes-NOT-@atlantic.net
Message-ID: <zI5Db.961$MY.713464@monger.newsread.com>
Source record: 22240

Hi All,
My system hangs while trying to copy large files around 10 meg or more!
This started after replacing one of two hard drives. It occurs when trying
to copy from either of 2 CD drives, from either hard drive to each other or
within either hard drive! I've checked ID #s, swapped out cables (total
length is about 11 feet), reconfigured HDDriver and Extendos Gold, done
sector tests on both hard drives and a memory test on the 14 meg RAM.
I believe termination is ok (older Seagate, last in chain, no jumper =
terminated.....new Seagate, second in chain, no jumper selection or
termination power from cable).
Physical order of devices:
C-LAB Falcon
Yamaha CD R/W CRW2200S
Seagate ST15230WC SUN 4.2g
Toshiba CDROM XM-5401TA3605
Seagate ST51080N 1g
Any Thoughts?
John

Yes, thoughts. Have you done a websearch on either Seagate part number?
I have more than one ST32550W, and one of them was acting very strangely.
Found that typing the part number into a search engine box revealed that
many people had strange problems with that drive, and one fellow bought
12, and found that only 4 of them worked in his systems. That told me what
was wrong, and what to do about it. Skipping a lot of steps, after finding
those reports, I installed three jumpers on the top of that drive,
connecting termpower to the terminators, to the network, and connecting
network termpower to the drive, and now it works just fine, in the middle
of the chain, and very thoroughly in the state some people would call
terminated.

First do that web search. If you are the only one with a problem with a
drive which is about the right size for a Unix system, that is not the
problem. And, shorten those cables. Those drive should at least be in the
same county. That could be all of your problem, or fix your problem.

And, block size might matter. There is Kobold, and there is tosfix, to
break transfers up into sizes that do not cause problems.

Jim

7960. Atari stuff - advice on what to do with it - (no rude answers please!)

Newsgroup: comp.sys.atari.st
Date: 2003-12-15 00:44:18 UTC
From: IanL <Ian.Lawden@-No-Spam-btinternet.com>
Message-ID: <brj052hpe1@sparta.btinternet.com>
Source record: 22242

Hi all,

I have to move to a smaller home - and, sadly, have to part with my Atari kit that has been set up for years (but barely used of course.)

I have: -

Atari Mega 4
Atari 60Mb HD (it's now packed away but I think that it's a megadrive - £629 for 60Mb!)
SLM804 printer
Cumana Drive
Gadgets By Small Mac emulator (HD has a 15Mb MAC partition - very smart)
Atari Mono Monitor
All of the manuals for the above,
About 500 floppy disks with originals and 'backups' (was-not-was compressed games disks - remember them?)

Would these go if put on e-bay do you think? What sort of price.

Thanks for any advice,

IanL
UK - North West

Hi Jim,
cables are shorter than originally when it worked ok. The drive replaced
an older drive in the same box w/ps & fan. Using the original cables didn't
help.

>And, block size might matter. There is Kobold, and there is tosfix, to
>break transfers up into sizes that do not cause problems.
>

I have Kobold but in a French version which I hesitate to try :)
Tosfix sounds familier (didn't know that's what it was used for). But why
should I have this new problem after installing the drive and not before
(with longer cables)? I'll do the search anyway! Thanks.

Too late. This is the way GEMDOS (the GEMDOS cache) works, so it cannot
be changed. At least not without a completely new version of TOS :-).

The sector size depends on the partition size, i.e. you cannot change it
arbitrarily.

> configuration? You mentioned that the FAT/Data cache default is 100/100

Looks as if it is only 10/10. I don't know this by heart as I never
change it anyway.

Note that most of this discussion will lead to nothing. The GEMDOS cache
works as it works, it cannot be changed. Hard disk drivers have to stick
to what GEMDOS provides.

> 1Mb machine? Or is it only available on other platforms?
I think it's only available as an Atari program, though I play it on the PC through STeem. I think the ordinary version plays on a 520ST, but the size of the samples means I wouldn't try Filth on any less than 4Mb. It was written specifically for Yak's TT, so the more memory and processor power the better. It may easily dissolve into squeeks and burps on the crazier levels.

> Llamatron is my fave ST game; I've never tried Rude Llamatron but if

It's almost the only game I can play (apart from V-Rally on PS1).

Hi All,
After checking all that can be checked regarding hardware, termination, ID#s and cables, I booted with ICD and had no problem copying a 49 meg file from either of 2 CD drives to 2 hard drives or between hard drives but the system hangs if I boot with HDDriver 8.04 and try to copy a file over 10 meg! Same after reducing the system down to 1 hard drive and 1 CDROM.
So, is there a bug in HDDriver 8.04 or am I not setting it right?

Are you using screenblaster or blowup or any kind of screen resolution enhancement? I had this same problem with large SCSI transfers, and it was always even worse when using any resolution enhancement. I don't have the problem with IDE. I was told that it was a clock buffer mod problem, but I tried different clock buffer modifications and still had the same problem with SCSI. ICD would work, but I was told that there was danger of data loss with ICD related to this problem.

My work around was to install a 5 GB IDE drive and use it for everything except for Cubase Audio recording, which requires SCSI. My Falcon works like a charm with the IDE drive. Anyway, my problem was not HDDriver, it was the bug in SCSI on the Falcon. I never have any problem with SCSI writes if I boot in 2 colors at standard resolution. I can write to my SCSI CD-RW at 4X speed at this resolution.

> So, is there a bug in HDDriver 8.04 or am I not setting it right?

This is most likely a cable/termination problem, even though it works
with the ICD driver. HDDRIVER uses more SCSI signals in order to be
fully SCSI-compliant, so if anything is wrong on the bus you will notice
it more likely with HDDRIVER than with ICD's driver.
There are no known issues, btw, wrt copying large files. Whether it is
10 MB or 100 MB or just 2 MB, it's all the same for HDDRIVER, as
basically the same commands are sent to the drive.

> Just a suggestion anyway!

On a 32Mb partition the memory used is far less than on, say, a 512Mb partition, so the number of sectors will depend on what partition you're working with.

Also, the first figure relates to the root directory, so if you put everything in folders you only need a very low figure for the first figure. 10 or 20 would be quite adequate. You should get better response for a higher second figure.

That means using 20/180 should use the same RAM as 100/100, but provide more cache hits and less disk accessing.

> So, is there a bug in HDDriver 8.04 or am I not setting it right?

Even though you have stated otherwise I still believe that it is a cableing problem in that basically they are to long. When I tried using a 1 Metre extention cable with my HD on the floor I could copy floppies to it ok but copying 720K from the HD to a floppy would always result in the "Disk Damaged/Drive not connected" alert message. When I went back to the shorter cable cable (12-16 inch) that was part of the Link 97 adaptor everything was fine.
The reason why floppy to HD was ok is that the ST is relatively slow at reading data from floppy and transfrers it out in smaller chunks, I cant remember how large these are but it is defined by TOS however it does not work the other way because IIRC HD Drive transferes as much data as will fit into the available RAM from where the ST then copies it in the samller chunks to the floppy so HD to ST data transferes more data faster.

Now I know you will dismiss this because the longer cables worked with the ICD Driver but as Uwe stated HD Driver uses a fuller SCSI command set and the code may be more optimised than that of the ICD Driver, if either if these results in faster data transfere the extra capacitance of the longer cables will degregate the faster moving signals more that slower signal to the point where the recipient cannot tell if it is recieveing a 1 or a 0.

You say you have checked the cables but not if you tried HD Driver with shorter cables, if you have not give it a go you might find it works.

Stephen Moss

Hi Uwe,
I can copy a 4 meg file ok but 10 and over is no good! Running only one hard drive with a new cable gets the same result. This is a new problem since I put the files on the drive previously but now can't copy them (set to R/W).
The info on Seagate's site for the drive says that no jumper = terminated. Could the drive's jumper circuit be bad? If so, am I correct in saying that a passive terminator on the open external connector from the drive should fix the problem? If that doesn't work, then what?

resolution made no difference here! Are you saying that saving a massive
Cubase AIF file was ok? How do you copy it from the SCSI drive to another
drive? Is there a fix for the bug (in case that's my problem)?

John

I might be barking up the wrong tree here...
But I didn't have much luck with HDDriver 8 on a Falcon either. In fact, version 8 doesn't work with CuBase Audio at all.

I went back to version 7.93, which offers most of the same features as version 8...just less optomized, and run the CAFFIX patch, and so far, knock on wood, SCSI problems are gone.

This is on a CT2b with gobs of stuff on the SCSI BUS...wide SCSI III (with high bytes terminated), and narrow SCSI I and II (50 pin and 25pin cables) all mixed together. Okay, I admit when I'm doing serious audio projects I take out all the junk and use as short a cable as possible...but in normal day to day usage the chain is dangeriously long...and so far so good.

The first thing I'd try however, is installing the CAFFIX.PRG from your HDUTIL disk. If that doesn't do the trick, see if Uwe will send you 7.93.

Brian

This is a known issue, related to Cubase and the fact that Cubase
accesses to SCSI bus in ways not compliant to the SCSI standard. There
is nothing one can do about it, like with any software (Cubase in this
case) that is not maintained anymore.

Hi guys,
I just noticed that justdeals.com has the awesome Umax Astra 2200US (SCSI 2 & USB) on sale for 21.95. plus shipping. Here is the link:
http://store.yahoo.com/justdeals/spkg13434r.html?AID=10274075&PID=1167010

This scanner will work fine with ScanXPRO and ATARI/MagicMac/MagicPC systems. Add another $30 for ScanX pro.
Contact me and I will also give you a coupon for $6 off of the scanner, bringing the total to $16 for scanner and $30 for ScanX.

Happy Holidays.

cheers
Nima

7985. Re: HDDriver Copy Problem???

Newsgroup: comp.sys.atari.st
Date: 2003-12-16 14:21:02 UTC
From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3fdf14bb$0$24048$626a54ce@news.free.fr>
Source record: 22167

Please install the patch described in my 'CT60 fitting with solders' manual
on my web site : www.czuba-tech.com !

This consist of :
NO 74xxx chip on U63.
33 ohms resistor (SMD please) on R216, R221 & R222 places .
A 68 ohms resistor on the SDMA clock trace near the SDMA input clock and the
pin #14 of the AJAX chip (ground).

This patch work fine at 16, 20 & 25 MHz bus
BUT this patch is not recommended if you have a 68882 installed !
BECAUSE 68882 clock trace is connected to SDMA clock trace (very bad
hardware from atari !!).
Remove the 68882 OR isolate the clock pin of the 68882 from the socket pin
and connect the 68882 pin to a 32 Mhz source like the DSP OSC through a 33
ohms resistor at the beginning (near the OSC).

That's all.

I can too explain WHY the SCSI bug is more easy to see with enhanced
resolutions but that'a bit complex and boring ...

7986. Atari 1050 help needed

Newsgroup: comp.sys.atari.st
Date: 2003-12-16 15:13:59 UTC
From: Bill <bab5@eircom.net>
Message-ID: <TnFDb.1123$HR.3016@news.indigo.ie>
Source record: 22168

I recently was given the atari setupthat my brother had boxed and in his attic who asked my if I wanted it as he was throwing it out, an Atari 800xl, 1010 tape recorder and 1050 disk drive. All the hardware is fine except for the 1050 disk drive, he had taken it apart and never put it back together again.

I was wondering if anybody had a diagram or exploded diagram of the 1050 internals to help me put it back together.

thanks

Bill

I don't know if Brian use your lastest version but maybe it's another
problem, because I remember the bug with the MFP IO7 test on the 1st MFP
normally always used on D2D programs (STE/TT/FALCON) ;-) Lot of programs
use IO7 on the 1st MFP for the SDMA interrupt, the timer A is normally
used only on Soundtracker. Because old versions of HDDriver 8 test IO7,
when the SDMA works there are failure with SCSI disk drive.
I think Cubase use MFP IO7 interrupt, because DMA polling is too slow on
a normal Falcon.

Regards,

Didier.

Why bother defragging a flash card. It's not like a hard drive,
there's no mechanical parts no head to move, no seek time as one
memory location is as good as another. The only bits that will be
written are those that change. Unless you are constantly swapping from
memory to drive and back I can't see this being a problem. You could
always slave a second unit & use it for back ups at the end of a
session (or whenever).
The issue of defragging flash memory was raised on the psion series 5
& a program was available to do this. From what I remember it offered
no increase in speed.

My system works fine with moving large files as long as I don't use
Screenblaster. When I tried that it would often hang on large file
copies. Rodolphe Czuba says that I will be able to fix the problem
when I have installed my CT60 with solders and his recommended patch
(remove my old clock buffer patch).

Hi Uwe,
I reset HDDriver FAT/Data cache settings and I was able to copy a 47meg file! So, am I right in saying that if the cache is set too low that a hardware problem shows up? Rudolphe says the large file copy problem is due to the Phantom being a bad circuit design!
Anyway, it worked but I set the FAT/Data cache to it's highest (999/999) which eats up 6.5meg RAM /:). Maby it will work with a lower setting!
I also noticed different cache allotments after changing it around:
Originally 10/10 used 355k and 100/100 used 3.5meg RAM.
Then 10/10 was using 163k RAM so, just to see what happens, I set it for 1/1 which defaulted to 2/2 and it used 221k RAM.
Now, 10/10 uses 733k and 100/100 uses 6.5meg RAM!
Interesting!

John

I think I have to say again that HDDRIVER is not responsible for
maintaining the GEMDOS cache. It just provdes GEMDOS with memory for
them. So it is more than unlikely that changing these settings
influences anything on the BIOS level.

Hi Uwe,
Sorry, that's a little over my head! But I'm seeing a cache setting
problem now. I tried 10/100 and the file coppied ok. RAM used was 3.5meg.
Upon rebooting I saw 163kb instead! Is this showing a hardware problem?
Either way, I E-mailed you about getting 8.1 anyway.

I don't think so. But as long as the settings *and the partitions*
(since the amount of RAM used depends on the sector/partition size) is
the same the amount of memory used by HDDRIVER must also stay the sam.e

Jason,

The SuperNova card (Mach64) can do 1024x768x16 bit color. I have this one. The Matrix Coco can also do higher resolutions/colors but they tend to be a bit harder to find. I have a Matrix Moco/Coco upgrade card but it is non-functional. Lastly I have an AlberTT card. This card is more or less a rez expander, giving you 1024x768x16 colors. It's not too bad of a card, but scrolling is painfully slow and the display isn't too crisp.

I'd let go of the AlberTT if someone threw me $50USD. I know that's too much for this card but I don't really need to sell it. But if someone *really* wants one, it's there. I would also sell the matrix card but I am completely troubled by how much to charge. If someone gets the specs for the card, fixing it is a matter of 6 wires and it's a GOOD video card, but at the same time it's in non-working condition so charging full price would be very unfair.

Thanks,
Mark

Leon,

You're better off upgrading to 4 megs and MagiC. I don't know much about the STacy but I'd bet that they are SIMM upgradeable. Even if they're not you can find the memory upgrades pretty easily. After that pick up a copy of MagiC second hand (I think I have a version 5 copy I could sell). This won't run stuff like cubase or other close to the OS apps, but then neither will MultiTOS - put it in your ROM and you lose a LOT of functionality.

Negative on that one, it has chips soldered onto the motherboard.
Personally i wouldn't chance my STacy on that kind of surgery... A lof
of the non-SIMM solutions require you to remove the cpu and/or shifter
(not socketed in a STacy IIRC), cut tracks, solder in extra wires,
lift pins of chips, all scary.

If you have two different VGA adapters e.g "bugged" and "debugged" one try booting with bugged one and when booting is done chnage it for debugged one or vice versa. Use the monitor which works with CT2.
I had the same problem.

Depends on the RAM-board. I had one RAM-board with four SIMM-slots, and
one with four SIP-slots.

That's true, but the Nova cards are faster, atleast the ATI ones. I had a
1Mb Nova in my Falcon, and it was a *lot* faster than the Crazy Dots 2 I
currently have in my TT. I never had much problems with compatibility
either.

Hi, Leon!

LH> Ok, back to the original question:

Depends on...

If you use old style software, it will cope with 1MB for sure (exception:
pixel graphics: you'll never hava enough RAM for that...).

If you want the latest you can get for TOS, then 4MB are minimum.

Multitos is too slow, if you want multitasking on your (unPAKed) STacy.

Use MagiC or Geneva.

The first is the fastest preemptive you can get for your STxxx, but I'd
recommend a memory upgrade to at least 2MB. Otherwise there will not be
much space left for your applications.

The latter is not hungry for RAM and fairly fast, but only provides
cooperative multitasking. On 1MB STxxx you still have enough memory left
for a set of not that demanding apps. It is doing a great job on my
brother's STacy1.

Regards,

Alexander

My Stacy has a plug on 4meg board that takes SIMMS.
Point being...I don't think STacy RAM lives on the mother board...it lives on a daughter card that sits towards the front of the STacy.

I'd think you could find a plug and play memory upgrade if you try the remaining Atari shops like Best, ATY, Wiztronics, Atari Workshop, etc.....

Brian

Do all these TT cards fit inside the stock TT030 case? Or do they need a towerized TT?

The Matrix card in "Moco" mode if such a thing is possible is the original VME sized board. The coco upgrade board is a monster of a board that is attached (a big memory card) which requires a tower.

Clayton,

While I don't have an atari, I am having the same exact troubles with
my linux dial server. I start the PPP requests on my end but Fox
doesn't respond. Their tech support doesn't have any ideas at all.

My current theory is that since part of the move to the new NOC was
changing all of their dialup servers (some lucent box) the lucent
boxes either aren't setup correctly for PPP and are veeerry slow to
respond, OR I need to try and update pppd on my end.

I don't if you can update your atari pppd equivalent but it might be
worth a try. If you figure it out I'd love to hear about it.

As far as I know you will not find any software drivers that perform this, you will have to change the current TOS ROM's for UK versions (2.06) and hope that they are in sockets. You could try Key Change at www.keychange.co.uk or 16/32 Systems at www.1632systems.co.uk but your best bet will probably be Atari Workshop at www.atari-workshop.co.uk

If you want to try a software route there is software that will allow you load different version of TOS in the form of TOS image files although I can not remember the name of it just now I'm sure someone here will know what its called. The downside of using software it that it uses up Memory.

Stacy with 2 MB RAM can be upgraded to 4 using either SIPP or SIMM. 1 MB
Stacy has a different doughter board with soldered memory chips.

I have actually got an "Extra RAM Deluxe" ST RAM expander in my 1 MB
Stacy. It would have been _solder less_ but unfortunately one of the 2
sort of "piggy back" adaptors did not fit due to limited space next to
the chip (the square one). I solved this by soldering a small flat cable
to all the relevant pins on the adaptor and the other end to the bottom
side of the motherboard. Not too hard to do and no track cuts etc are
needed.

The memory expansion is located in the battery slot and it has been
working OK for many years (1992?).

[snip]
A fellow club member was suffering from what sounds like the same problem (monitor synchs lost so monitor goes into standby).

Since his NVRAM chip was socketed as part of the recasing project, it was possible to remove that chip, switch the Falcon on (boots normally), set the various NVRAM parameters, replace the chip (right way round!) and click on OK to reset its saved parameters.

This is all at your own risk.

Hi, Dave!

D> A good flash card will track sector usage and allocate another one if
D> it's getting near it's limit. A few million writes for certain sectors
D> should not be a problem for a good card.

Good point. If that really makes the difference between cheap and
expensive CF-cards...

D> Beware read the Manufacturers data sheet as the cheap cards don't seem
D> to bother.

If the manufacturers supply that detailled info... They usually grant
500.000 to 1.000.000 write cycles per sector, but don't tell you if they
do that kind of sector replacement...

Try to get used to it. A lot of stuff is in German, though if the primary system was in German I think I would probably get irritated myself ;-) Keith Scroggins has been selling TOS 2.05 english ROM's (lots of 6 of them) so he'd definitely be your best source. His email address is kws a.t saltmine.radix.net. Enjoy. I've used TOS 2.05 for a while and haven't had too many problems though there are some bugs out there (I've never encountered any of them).

Thanks,
Mark

Could it be that something is not releasing memory properly? I've had problems with (I think - can't be sure any more) Look'n See (Zeigsmir) running out of memory after it has opened a large number of files. It's either fragmenting the memory or not releasing it. After a reboot all is well.

John, how did you measure the amount of memory used? /Exactly/ how?

Hallo !

M>Is there a limit? I have a nice IDE 2.1Gb drive from a laptop that I'd
M>like to fit... any special s/w I need?

A disk that small should work with most available drivers, including CBHD and perhaps even the latest AHDI. There's a limit for IDE drives at 8GBb iirc, which can only be circumvented by using newer versions of HDDRIVER. And SCSITOOLS+HUSHI seem to have trouble with drives and surely with partitions in excess of 2Gb, but that won't apply for your drive.

If it shall be used with TOS also, I'd partition it to 6 or 8 equally sized partitions, which will reduce cluster size and thus make better use of the drive with large numbers of small files.

As for harddisk size in general, I've had a 40Gb drive installed on the SCSI chain of this Falcon (actually an IDE drive with ACARD SCSI-to-IDE-adaptor), and it was working straight away.

The boot screen shows HDDriver allottment which agrees with the used
memory in "General CPX/Status" (minus the memory used by Auto folder
programs). So if I have 11 meg RAM free in General CPX I assume 3 meg is
used by the system (NVDI, FAT/data, etc.). If I raise the HDDriver FAT/Data
cache and it uses 2 more meg then (again I assume) 9 meg should show in
General CPX.
My latest question though was regarding the allottment by HDDriver on
the boot screen which didn't reflect the high FAT/Data cache I set in
HDDriver.app. At first it was changing accordingly (low setting = low
allottment....high = high). Then I saw 163kb (the lowest I've seen here)
for any setting. Hard rebooting by keyboard or shutting the system off/on
still showed 163kb. It now seems to be reflecting the setting ok.
Unfortunately I didn't think to check the CPX in that case and, again I
assumed that the boot screen was accurrate!

Meffy,
In theory there should be NO upper limit of the Hard
Drive's storage capacity. You could have a 250 GB
Hard drive and be running Magic with Jinnee or Mint
and HDDriver and have 2 125GB partitions. BUT I
believe Magic and MINT both have a 138 GB IDE limit.
Remember this is under MAGIC or MINT running HDDriver.
You will not be able to go past 1 GB using TOS and an
older hard disk driver. But to answer your question a
2.1 GB should work fine under normal TOS conditions.

Thanks,
Carey Christenson

2.1 gig will be no problem whatsoever....
If you want access to all your partitions under the plain jane default desktop, just keep your partitions a gig or smaller.

An advantage to smaller partitions is that you can use smaller sector sizes, which means less wasted space (a sector is the least amount of disk space any write operation can use...so even if you have a file with 2 bytes in it...it'll still take a full sector).

The advantage to larger partitions...is that you don't run out of Drive letters as quickly ;)

At any rate...2.1 gig IDE on a Falcon....shouldn't be a problem at all.

Brian

Have you ever been inside this STacy?
Mine has a memory board that takes 4 1X8 SIMMS.

This was most likely an aftermarket board (I got the STacy used), but hey, ya just might be lucky and have this board in your Machine.

If you do open the STacy...get someone to help you and be very careful...
It's pretty straight forward, but an extra pair of hands will save you alot of grief.
If you do have to work it by yourself...it can be done...just use some sand bags, pin coushions, beanbags, or something along those lines to afford you some wedging/holding support.

Once you get the screws out and 'carefully' pry the top and bottom apart (not too far!), you'll barely have room to get a hand in and disconnect the keyboard (this will be a tight manavoure)...the tricky part from here on is that there is a short set of wires that plugs onto the mother board and leads to the screen (top half of the STacy). These plugs are located on, and underneath a daughter card just forward of the MIDI and Monitor ports...carefully pull this card upwards and set it aside inside the machine (don't try to pull it 'out' of the chassis...there is a wire soldered to it). Next, unplug the screen wires and the top will finally come off so you can easily get at everything else.

Once you get the shielding off...you'll see a large second level PCB nearly the full width of the STacy towards the front (under where the keyboard was). Lift that out of its sockets, flip it over, and see what ya got.

Unless you, or someone you know is really good, and super paitent with a soldering iron, I suggest you exhaust all your sources trying to find a prefab 4meg STacy board. If you can find a board...it's really easy to unplug the old one, and plug in the new one.

Best (USA), ATY(USA), Wizztronics(USA), and Atari Workship(UK) come to mind as likely to have some memory boards in stock. Web searches on those names should provide contact information. No doubt there are more places in Europe (Namely Germany and France) to check as well...I'm just not famaliar with them being an English speaker.

If you can't find a prefab memory board....
The Chips'n'chips and DoIt archives offer instructions on how to hack in various types of memory (SIMMS, DIPS, SIPPS, etc....). Alot of these hacks are

described in German or French only.

It might even be possible to strap in some of the regular ST memory upgrades...these usually connect somehow with the MMU chip (using a pingrid, clamping, or socket adaptor) and like to ride on a riser in the Video Shifter area (pull out the video shifter chip, plug on the board, put the shifter chip in the memory board). I don't know if there is space enough for these type RAM expansions...but I'd think hacking one of these in would be MUCH easier than trying to trace out a million and seven resister points and running wires into some kind of home-made SIMM adapator. That would be the advantage to a kit like that...the resisters and such already be in place. With Schematics to the STacy's memory board pin-out...you might could even find a way to build a relatively simple adaptor to just plug the thing right on where your current memory board is. I dunno...just food for thought.

Hope this helps, and good luck,
Brian

Most likely a Stacy with original 2 or 4 MB. 1 MB versions are different.

Hm, I have dismantled mine the "other way round". By starting with the
two screws under the _inside_ sticker that says " Stacy" (sorry you
need a genuine Atari charset to se the Atari logo...) you can separate
the screen part and then very carefully take it apart by lengthening the
cables to the screen. They are quite delicate and easy to damage. People
with little patience should definately stay away from dismantling a
Stacy...

Exactly. As I wrote in another post today I did put a Marpets Extra Ram Deluxe memory expansion in mine. Some soldering will be needed and a cut in the plastic to allow the SIMMS to sit in the battery compartment. Not too hard to do by a careful person. To get under the motherboard for soldering most of the computer has to be taken apart if I remember correctly...

You could make a decent offer for my Stacy 4. No hard drive and the screen
is dim but it works from floppy.

<kennethm@tripnet.se> wrote:

The proper way into a stacy is by unscrewing the 2 screws that are
behind the 'prise out' ATARI Stacy logo under the screen and then
gently levering the 2 halves of the screen cover and surround apart.
This then exposes the hollow screen pivot through which the screen
wires pass.It also gives access to the spring loaded bit. It is fiddly
but not as fiddly as trying to unplug (and worse still replug) the
keyboard whilst the main keyboard surround is still attached..
Generally if you find you having to do somthing that seems impossible
thats because you are taking something off out of sequence. Remember
they had to put it together too!!
Bring it or send it to me if you don't feel confident. Done it
loads of times.
I've even got a T28 accelerator shoe horned into my Stacy
although I still have not managed to modify the internal PSU to cope
with the extra asked of it. I have 4mb RAM , 240mb Hard drive and the
stated T28. Everything works a treat until I need put something on
floppy. As soon as the floppy drive starts the system shuts down and
reboots. It is the straw that breaks the camels back. I suspect there
is a way of squeezing a little more power out of the PSU but I've yet
to find how.

Hi,

After looking at the spec sheets for the various cards I have here the trend
over the last two years is that most manufacturers don't bother any more.
Probably cost related but also the technology is so much better so a good
card will offer approx 1000K writes where as a cheap one is about 250K.
Sandisk (pretty expensive even today) definitely did the sector allocation
as
I have cards here that have had well over 1000K writes used in real time
data loggers and upon interrogating the card it lists reallocated sectors..

I also have an IDE flash card sent to me by a manufacturer about 3 months
ago
that has a 44 pin 2.5" connector on it. Even though I have no Atari Kit
left to test it on, I will take it down to Keychange as Barrie still has
some IDEal interfaces so I will test it on an STE and Falcon. Will report
back to the group
if anyone is interested.
I would be surprised if it didn't work straight out of the box.

Dave

8048. MagnumTT Ram Card and types of Simms?

Newsgroup: comp.sys.atari.st
Date: 2003-12-21 01:20:10 UTC
From: Tim <TjLaZer@NOSPAM.Mail.com>
Message-ID: <vu9ta9lh0i5b29@corp.supernews.com>
Source record: 22130

I just got this MagnumTT Ram card from Germany. It accepts 16, 32, 64, and 128MB PS/2 type SIMMs. I cannot get it to work and my lack of german is also complicating things! The manual is in German and it talks about jumper settings etc. I have been able to figure out the settings (I think) for the SIMMs but not sure what I am doing wrong. I tried 3 different SIMMs: two type of 16MB EDO's and some 32MB EDO's. None work.

Any ideas or help would be most excellent!

>type of 16MB EDO's and some 32MB EDO's. None work.

You need 5V SIMMs, either FPM or EDO. The modules must have a symmetrical
RAS/RAS mapping - the manual lists numbers of RAM chips that do / do not
work (see http://heisenberg.ccac.rwth-aachen.de/~michaels/files/magnum/),
"richtig" means "correct type".

3.3V DRAMs may well not work - often, these have a "V" in rthe middle of the
type number, or start with "HYB31", but to be sure, you have to look up the
exact datasheet.

When using different sized modules, the bigger module must be in bank 0.

On old TT models with the CPU on a daughterboard, you may have to enable an
additional wait state. In that case, change the jumper from 0WS to 1WS.

If the presence detection pins on the modules are wired correctly, you need
no jumpers on any of the PD jumper positions - these are just a fallback in
case of badly designed modules, which shows as a module being detected with
the wrong size.

Message-ID: <3cd077ed.0312211341.6fde29d0@posting.google.com>
Source record: 22133

Hi

I've just resurrected my Falcon030/4MB and am trying to get some use out of it. Specifically, I have the following questions:

1. This machine has no FPU. I do have a Motorola 68882 FPU out of a Commodore Amiga 3000. Is this the same FPU ?

2. I would like to get my external SCSI-II CD-ROM drive working (I have it connected to an A3000 at the moment). What drivers / necessary steps do I need to take to get it working?

3. Can I upgrade the RAM on this to the full 14MB? I have seen some posts of people using non-EDO RAM in these machines. I have a 16MB stick lying around....can I use this ?

4. Any ideas of good software / games to use on the Falcon ? I don't want to spend money....just get a bit of use out of the thing.

Thanks for the help !!!

DM

>The SuperNova card (Mach64) can do 1024x768x16 bit color. I have this
>one.

Only a hundred of these were produced & sold, the one I've got goes all the way up to 1280*1024 in 24bit resolution. The maximum resolution of the card is 1920*1080 in 8 bit at 65Hz and 75Hz in monochrome BTW. The main difference between the SuperNova and the other Nova cards is that the Mach64 card contains VRAM and that makes quite a difference...

To answer the original poster his request:
The card with the best screen resolution and also the fastest for the TT is without any doubt the SuperNova, but all the other Nova cards with an ATI graphic card will outrun the competition easily, even cards with the Mach32 processor are a lot faster then the competition. The problem of course is how and where to obtain such a card... :-/

Cheers from Belgium
Dennis

Falcon need a PLCC MC 68882 RC-20 or -30 FP

> 2. I would like to get my external SCSI-II CD-ROM drive working (I

Connect your drive an try "Spin" Driver.
Best way is to use "ExtenDOS" from Anodyne-Software.
(One driver for CD-Rom and CD Burner)
Simple setup.

> 3. Can I upgrade the RAM on this to the full 14MB? I have seen some

That need a ram board that can use this kind of ram.
Wizztronics, WB-Systemtechnik are names on scene.

> 4. Any ideas of good software / games to use on the Falcon ? I don't

Several sites on the web contain a lot of free software.
Use any atari link page to found them.

Regards, Robert

> steps do I need to take to get it working?

Plug in and format, if you got all the software with the machine you should
have AHDI, version 6.06 is the latest.

> 3. Can I upgrade the RAM on this to the full 14MB? I have seen some
> posts of people using non-EDO RAM in these machines. I have a 16MB
> stick lying around....can I use this ?

Nope, the Falcon has a proprietry ram module. I can supply you with a pin
out of the memory connector if you want to DIY it. Or you could look here
http://www.myatari.net/support.htm for a list of suppliers who stock Ram
adaptors. The Ram has to be Fastpage, i.e. Non-edo to use with most adaptors

>
> 4. Any ideas of good software / games to use on the Falcon ? I don't
> want to spend money....just get a bit of use out of the thing.

http://www.1632systems.co.uk/ stock alot of Falcon games to buy. But for a
few freebies

http://www.martin-steen.de/hicolor/hicolor.html

http://www.users.zetnet.co.uk/atari_shack/download.htm#Falcon

http://www.umich.edu/~archive/atari/Falcon/Games/

But you won't be able to profit from it without a hard disk driver
supporting IDE drives of that size. HDDRIVER is known to work with
drives up to 128 GByte. It should also work with larger drives, but so
far this has not been tested as far as I know.

Why should they have such a limit? It is the hard disk driver that limits the capacity of the drives you can connect to an Atari. The operating system just limits the partition size, but not the drive's capacity.

>You can even put MagiC into your ROM and save some memory.

I did that (i.e. put MagiC into ROM) and the general impression is that
it is not worth the trouble. MagiC needs so many files from the disk
anyway (drivers, a desktop, etc.) that saving about 200KB of MAGIC.RAM
(the one that you can put into ROM) dosn't mean much.

Another impression that I gat was that, in case of a system crash
(and MagiC likes to do that more often thatn TOS), it seems harder
to recover if it is in ROM- generally, one has to turn the
computer OFF/ON.

Do you know if I need 2k or 4k refresh SIMMs? AFAIK all 72-pin SIMMs are
5V. I have never seen a 3.3V one. I tried FPM, EDO, different sizes and
not will work. These SIMMs work in my Amiga 060 card just fine. I am
beginning to think that maybe my TT card is dead, or it is just really
really picky about SIMMs!!!

That is Amiga Commodore Users Group #0447 (formally called Astoria Commodore Users Group #0447 as it also supports the Amiga and serves beyond the Astoria city limits.

Anyway, good luck with the show - I'll be in the midst of some busy stuff and hope to be there next year. Some that may be availably known in the future.

Every going to the show, enjoy and have a good party. Hope to see Jeri sometime. :-)

Hmm what we need I think is someone to test some SIMMs on a card and then
try it on our card. Or somewhere to buy known working Simms for our card. I
do not want to keep buying Simms blindly hoping they will work!

Good, I was just about to throve my Stacy on you, and we both know they
are heavy... :-)

But there may have been late Stacys with a SIMM compatible daughter board
populated with only one MB sold? I bought mine around 1990 and got it
quite cheap just because it only has one MB RAM.

(I'm actually writing this on the very same Stacy 500 km from home!)

8076. CT60 delay for people waiting for ...

Newsgroup: comp.sys.atari.st
Date: 2003-12-23 18:41:26 UTC
From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3fe88c47$0$1175$636a55ce@news.free.fr>
Source record: 22057

This mail is sent to people who are waiting for their CT60 (12 people) and on ng because one guy (the 13th has now a bad email in my database : hey mister Alexander Feige, if you read me, give news and your good email address !) :

As I recently explained on the English atari newsgroup (comp.sys.atari.st), I ordered in July 24 pieces of 68060 at an USA company (Vernal Elm) that never sent me the marchandise and I lost 1.728 USD !

So, now my personal financial status is bad and, some of atarians sent me donations, but it is very difficult for me to continue the CT60 development. I'm not sure I will produce a second serial.
About last shippings, I have two problems : money to order the last 060 and, the most important now, finding a new 060 source.
I'm tracking now a german company that will maybe gives good results but I have to wait for their answer and suerely after the end of the year.

I'm very sorry for the delay after Christmas because I was thinking to ship all last boards for this nice goal....

I hope you understand that I can't do better this time...
So keep cool ...and I will solve the problem and find 060.

Happy Christmas and New Year...

Several - I have seen way too much of these crap - at some point, 3.3V RAMs
got cheaper than 5V RAMs, so they ended up on lots of cheap SIMMs, despite
the fact that using these in a system with 5V signalling on the data/address
lines causes problems. Usually, there is some kind of voltage regulator on
the SIMM - either 2-3 diodes in series, or a 3-pin SOT223 or similar device.

>not will work. These SIMMs work in my Amiga 060 card just fine. I am
>beginning to think that maybe my TT card is dead, or it is just really
>really picky about SIMMs!!!

The problem is that the card must bring up the SIMM without the help of the
TT's CPU, and with limited ressources available in the programmable logic
chip, so it could handle only a single type of RAS/CAS mapping per modules
size, and at that time, symmetrical modules were the most common.

As memory chips grep to larger capacity, asymmetrical chips got more common,
so that causes the problems - that's why there is the list of DRAM chip
numbers in the installation guide.

It has to deal with the ram itself : not all are compatible with expansion
boards.
For instance, I bought a 32MB with 8 x 3 chips simms (4 MB each simm).
I had 4 another 3 chips modules, but these caused random crashes.
So, before thinking of trashing eitehr your expansion board or your TT, be
sure you can get the right type of memory.
IIRC, those of 4 MB in older Macs are (not quite sure however)

8083. Re: MagnumTT Ram Card and types of Simms?

Newsgroup: comp.sys.atari.st
Date: 2003-12-23 21:06:01 UTC
From: Jim DeClercq <jimd@panix3.panix.com>
Message-ID: <bsaanp$5p0$1@reader2.panix.com>
Source record: 22068

My experience has been satisfactory, but imperfect. I got a few Magnum TT boards. Posted a want list in alt.computer.memory, and two sellers responded. One had 128 MB SIMM, so I ordered some of those. Plugged two of them in, put it into a TT, and only 65 MB was recognized, by either the desktop or sysinfo.prg. For me, that is still more memory than I will ever use. If I want to take it apart again, I could try swapping slots, or swapping memory, or getting the JDEC standards and hacking the size bits, or at least reading what they say. Am not planning to do that.

The worst that happens is that I paid 30 USD more than expected for that much memory.

The SIMM have 16 rather large chips of one type, and 8 of another. The paper sticker on the SIMM says KMM53623000CK-6. On the board itself is SAMSUNG, 53632000AK2(#) and AD0823-01. What is the part number?

Also have some 64 meg SIMM, with 36 chips on it, and some 32, with 18 chips on it. They are untested. Should these work? Either number of chips is also divisible by three!

Jim

And guesses as to where the rest of the memory went to will also be appreciated. 64 MB seems to be missing.

Are you saying *each*application* takes 1 Meg !? I heard Atari ST
app's were compact, and I have bloated pee see app's from the same era
(late 80's) that are 80k and use another 64k for data.

Source record: 22066

Hi, Leon!

LH> Are you saying *each*application* takes 1 Meg !?

No, not at all.

LH> I heard Atari ST app's were compact,

That's true. Old style word processors for example will happily do their job with memory amounts you remembered. So several apps would fit into 1MB easily.

But if you want to go multitasking you have to consider the RAM loss due to the multitasking environment plus the fact that some of the older software might proove buggy under multitasking OSes. So you might need newer software that might demand more system ressources - including RAM, NVDI or different OS extensions (that consume RAM again).

In general I'd say that you can run two or three not too demanding apps under Geneva in 1MB RAM. Sufficient for your purposes?

Regards,

Alexander

8092. TeraDesk 3 is available!

Newsgroup: comp.sys.atari.st
Date: 2003-12-24 23:42:32 UTC
From: vdjole@EUnet.yu
Message-ID: <bsd88qndu2@news.eunet.yu>
Source record: 22074

Version 3.0 of TeraDesk, the only open-souce desktop currently existing
for the Atari computers, is now available !!!

Almost exactly a year ago, TeraDesk was made open source, Henk Robbers took
over its maintenance and TeraDesk V2 appeared.

In December 2002, after an exchange of ideas about possible upgrades of
TeraDesk, Henk kindly invited me to participate in its further development.
The first result of that cooperation TeraDesk V2.3 in March 2003.
Since then, we have been working on TeraDesk 3.

Our goal has been to maintain TeraDesk as a small, simple, fast and reliable
desktop, which would be functional in the modern multitasking environments,
and yet to keep, as much as reasonable, familiarity with the original
TOS desktop, and keep it undemanding enough to be run on any Atari computer,
even the one with the smallest amount of RAM and oldest version of TOS
(currently TeraDesk is a little less than 129KB in size and uses about 200KB
of memory). In my opinion, the cooperation has been a fruitful one, with an
unspoken division of labor which suited both of us. Henk concentrated on
memory and file management, new configuration file concept and also on
multitasking-related issues, while I added some new functions, made some
optimizations, and worked on improving the graphical appearance of the
program.

Lately, Henk decided to move on to other matters, and asked me to finish
what was required to publish TeraDesk 3. I have tried to do that to
the best of my abilities, but Henk's assistance is sorely missed :(

Anyway, though there are still a few unsolved problems (i.e. bugs)
in TeraDesk 3, it appears to be sufficiently good to be published
and used. It is available at:

http://solair.eunet.yu/~vdjole/atari

and divided into three archives: the binaries, the complete source, and the
V2-to-V3 configuration-file conversion utility.

Many changes and optimizations were made, new features added or existing
ones improved, a number of bugs removed- and hopefully not many new ones
introduced ;)

A short (well, not so short) list of changes and new features:

H. Robbers:

- Configuration data now in text mode, in a new file teradesk.inf;
Easy to keep compatability. A set of routines for reading/writing
configuration items and implementation of a concept which will make it

very easy to add new configuration items.
- Replacement or heavy modification of many routines to adjust to the new configuration file requirements.
- Colour palette is saved in a separate (text) file teradesk.pal.
- Program cfg2inf.prg for converting the binary cfg to the textmode inf.
Source code adjusted so that it can be compiled for reading either the old binary configuration (cfg2inf.prg) or the new text file (desktop.prg)
- Replaced use of Malloc (Gemdos) to standard malloc.
This reduces memory fragmentation on the Gemdos level considerably, especially important in multitasking environments.
- Replaced Wout's mememory allocator by mine (AHCM).
AHCM allows memory leak detection and reduces fragmentation even more by always allocating Gemdos blocks in whole multiples of chunk size.
- As a result of the above it wasn't possible anymore to shrink the start amount of 2000 directory entry structures (68 Kb).
So I implemented a pointer array instead. It starts with 256 entries (1 Kb) and is mildly exponentially expanded when needed.
- cfg2inf.prg: The editor string in the old config is converted to a flag for the (installed) editor in the new config. So it is preserved if the editor was installed.

Dj. Vukovic:

- Fixed a bug of not immediately refreshing a changed background pattern/colour in text windows;
- Fixed a bug of not correctly setting and so corrupting type of desktop icon in desktop icons dialog;
- Fixed some bugs which disabled printing of more than one file at a time;
- Fixed some bugs in scrolling text fields (cursor placement, padding...)
- Fixed a bug which swallowed the first char of command lines for .TTPs
- Corrected enabling/disabling of some menu items depending on context;
- Fixed bad redraw of animated colour icons;
- Fixed several bugs related to memory (de)allocation and buffer overruns
- Removed some overlooked fixed keyboard shortcuts from previous version;
- Made some fixes which (hopefully) will correct improper window and dialog redrawing with XaAES only (V0.963).
- A lot of source code cleaned up and size optimization;
- Some optimization of desktop.rsc and the use of it;
- Massive reorganization of dialogs which handle what are essentially filetype or filename lists (i.e. file masks, program types, document types, icons...) so that there is only one filetype-list dialog in desktop.rsc; significant reduction in executable code size because a lot of routines are made to work on all file/filetype lists. Same concept is used for entering/editing all lists: filetype masks, program types, window icon filetypes and applications.
- Reorganization of "Install Application" function (see above); a dialog is shown displaying a list of installed applications. Further reduction in code size.
- ALL dialogs now fit ST-low resolution. Some are reduced in size even more for faster redraws on low-end machines

- Several small fixes and improvements in floppy formatting routines;
floppy drives are locked during formatting/copying in Mint & MagiC;
- Somewhat improved handling of overscan hack (tested with Lacescan);
- Improved operation of the "fuller" gadget: a) fulled window is moved left
until it is completely on the screen; b) in "hex" mode the window is made
only as wide as needed;
- Much improved graphical appearance of dialogs (proper background, colours
and 3D effects in modern AESses, etc.) Significant reorganization and
simplification of routines.
- Added window iconify/deiconify capability in AESses which support it
(AES4.1, Geneva, Magic, XaAES...)
- Added checking for duplicate entries in filemasks, program types,
window icons and applications lists;
- Added posibility to start an application or program type in "no-multitasking"
mode in Magic (not working very well yet);
- Added possibility to limit memory available to a program type or application
in multitasking environments.
- Added capability to call a file selector in scrolled input text fields
in dialogs upon pressing the [Insert] key
- Added capability to mark an installed application as "autostart";
- Added capability of "Search" to find text in files as well;
- Added "touch" ((re)set time/date and/or file attributes) functionality;
user interface implemented through additional button in the "Object info"
dialog. Considerable reorganisation of that dialog(s). TeraDesk is now able
to display DOS/Windows folder attributes (and respect them to a degree)
though not able to change them.
- While copying files it is possible to change date/time and attributes.
- Added "Compare files" functionality; a nice knack is that it tries to
resynchronize search positions after a found difference.
- Improved "Open..." function; it now tries to figure out what type of item
should be opened: a program, a folder/drive, a file assigned as a document
to application, or an unassigned file. In case of a program/application,
it is possible to enter a comand tail after path+name;
- Command line dialog for .TTP programs remembers last command if the same
program is activated again.
- Filename/filetype entry forms in dialogs appear in 8+3 length if there is
no long-filename-capable OS present (i.e. without Mint or Magic);
- [Shift][Help] calls ST-Guide (if available) to display TERADESK.HYP;
- Nicer display of long window titles;
- Improved recognition of TOS and AES versions and their capabilities
and limitations;
- Updated the .HYP documentation (not quite satisfactory yet)

Some possible areas of further work- though I am not sure how probable;
a lot of time needed :(... some help might be useful :)

- removal of bugs;
- multiple column display of directory windows in text mode;
- improved manipulation of file attributes for non-tos filesystems
- integration a windowed, long-filename-capable fileselector reusing
a number of TeraDesk's existing functions and capabilities to minimize

code size;
- documentation update;

Have fun.

And, of course, have a Merry Christmas and a Happy New Year !!!

Djordje Vukovic

I had finger trouble. Where I ask for memory when I need it is

misc.forsale.computers.memory

I post what I want, and eventually, I get it.

My apologies if anyone tried the wrong usenet group.

I just tried installing a 6GB IBM HD in my Falcon. When I boot up with AHDI, the drive is recognized as an IBM IDE drive, but I'm unable to fomat or partition the drive with HDX. When I try partitioning, it says that the drive was partitioned with an older version of HDX, and attempting to format comes up saying that the drive cannot be formatted. Any ideas? Is AHDI the wrong driver to use with this drive?

My knees and feet are sunburned, it was so hot here and with the sinking of a few beers you don't notice how hot it was getting. 28 degrees C quite mild for this time of year. Christmas lunch was awesome. Now to clean up the carnage. Might play a little star Raiders when I'm done. Then a siesta.

Good night

8109. Yamaha Soud Chip Synth Program

Newsgroup: comp.sys.atari.st
Date: 2003-12-26 00:13:44 UTC
From: A Walshe <acs@webaxs.net>
Message-ID: <bsfufo$16c2$1@arachne.labyrinth.net.au>
Source record: 22091

Hi all,
Does anyone know of an application for programming the Yamaha sound chip present in all Atari computers.

I have looked at ST synth (looks like a STOSS prg?) and some of the chip trackers such as XLR8 but they are either buggy, unintuitive or lack capabilities. I am looking for a dedicated program to take full advantage of the chips capabilities that is easy to use and doesn't need to sequence just generate sound.

Thanks

Hallo Tim!

TW>Is AHDI the wrong driver to use with this drive?

I'm afraid it is so. I've just installed a 40Gig drive on the SCSI chain in this Falcon, partitioned with HDDRIVER's HDDRUTILS and it was working instantly.

Just one problem: I'm now out of drive letters and therefore will have to remove some of my smaller harddisks. But otoh, I can afford that :-)

With best regards
Ekkehard

I'm using the ICD Link II software that came with the adapter. For some reason, the CD Rom isn't being seen. I have it terminated at the end of the chain and there is 5 volts present as the on board LED is lit up. What I'm not sure about is the termination at the first drive. I don't know if this adapter requires termination both before the device and after or just at the end of the chain.

I ended up trying CBHD, which seemed to work, as I was able to partition my hard drive and read and write to and from it. However, upon rebooting, the system gives me three bombs after running the memory check. I tried booting from floppy by holding down Alt (is this the right key?), but that didn't change anything. I'm now seemingly stuck with a non-booting Falcon! Can anyone offer advice on what I've done wrong?

Tim

53632000 or 53623000? I would guess the4se should be the same, however, they
do not look like the part numbers which Samsung lists on their website.

Unless you can post a link to a datasheet, these are useless - what's
interesting is the number of DRAM chips and the exact part numbers of them.

Message-ID: <20031227232730.a16493@du3.maus.de>
Source record: 22009

Hi everyone,

I just want to tell that with TOS 4.04 (0.99g), ABE 5L and SDR 5E my NOVA software (EMULATOR.PRG and STA_VDI.PRG/Afterburner versions) runs on my ct60.

Unfortunately when I install the NOVA card itself in my Falcon the computer immediately crashes. The ATARI logo (not the ct60 logo) appears but only in a very distorted way and then the computer hangs. :-(

I don't know whether it is the extension of the falcon bus or the new firmware of my ct60.

Is there anybody out there who uses his NOVA with the ct60?

Regards,

Frank

8125. Contacting Atari

Newsgroup: comp.sys.atari.st
Date: 2003-12-28 00:43:52 UTC
From: Draco18s <draco18s2_DOES_NOT_LIKE@SPAMhotmail.com>
Message-ID: <MPG.1a57f11e527c9ace989ae2@News.CIS.DFN.DE>
Source record: 22006

Can it still be done? Is it possable to call Atari and talk to a live person? If so, what's their number? I don't care who I reach, so long as they work at Atari and I don't wander endlessly through Voice Jail.

Thanks in advance

8126. Re: MagnumTT Ram Card and types of Simms?

Newsgroup: comp.sys.atari.st

Source record: 22007

Thank you. Now I have at least a better idea of what I do not know.

km44c16100ck-6 --16 of those
km41c16000ck-6 --8 of those

I will have a look at the Samsung web site, but if you can give me the
proverbial clue as to what to do with the information on the chips, I
would be grateful.

Now to see if CAB and Google can find that web site.

Thanks, Jim

From: Ekkehard_Flessa@wun.maus.de
Message-ID: <200312280850.a46286@wun.maus.de>
Source record: 22020

Hallo Tim!

TW>I ended up trying CBHD, which seemed to work, as I was able to
TW>partition my hard drive and read and write to and from it.

Sounds good.

TW>However, upon rebooting, the system gives me three bombs after running
TW>the memory check. I tried booting from floppy by holding down Alt (is
TW>this the right key?), but that didn't change anything.

Try the other keys (and combinations), too. That is both shift keys and
control. I'm sure there is some way to avoid the hd boot. [later] I tried it,
and it seems control+alternate is the right combination.

TW>Can anyone offer advice on what I've done wrong?

I'm afraid CBHD is lacking support for IDE drives. At least that's stated in
the german hyp-file. But as you were able to partition the drive, it could be
possible to access it with AHDI now.

The latest AHDI (and some older versions) are available from
ftp://gem.win.co.nz/hall/tos_206/ahdi.zip.

mit freundlichem Gruï¿½ aus Ahornberg

These are 16M*4Bit, FPM, 4k refresh, 5V.

>km41c16000ck-6 --8 of those

These are 16M*1Bit, FPM, 4k refresh, 5V. These are for parity, which is not used on the MagnumTT, so we only need to look at the 44C16100 chips.

16*4 = 64 bit, so we have 2 banks of 8 chips, with 64MByte per bank.

4k refresh on this chip means 12 row/column addresses, which is just fine for the Magnum TT, so this module should be exactly the right type.

Now there might be a problem with the PD pins on the module, which encode the size, but both pins open means "128MB", so it is unlikely the manufacturer did these wrong (beside, Samsung knows what they are doing - this is only a problem with certain noname modules).

The only other thing I can think of is either a timing problem between the Magnum TT and your TT board, or a bad module (which I would think is not very likely). Have you tried setting JP1 to "1WS"?

>I will have a look at the Samsung web site, but if you can give me the
>proverbial clue as to what to do with the information on the chips, I
>would be grateful.

I have the datasheets here, so I will not again try to find them on Samsung's website - it is a bit tedious to get to the point there.

Hey community,

Just wanted to let you guys know that after some work GIM, now has a basic GEM skeleton done. I have selected Windom as the GEM Library. Some day GIM may run on xgemlib but there is a lot of work yet to be done there. Currently GIM has the following done.

Basic skeleton and handlers,
About Dialog, Quit alert, main window.

I'm working on some config stuff, but gah, this is REALLY slow going. Much more challenging than I ever could have imagined. Surely though as with most things, it's a steep learning curve but soon you will start seeing progress increase exponentially. GEM Programming is a first for me. Windom may be high level, but you still have to learn!

Depends on what you mean by ATARI. If you mean the folks who built the ST/TT/Falcon hardware then the answer is NO. They are long gone from what is now called Atari. The ATARI name and rights to the software were all aquired by HASBRO who recently (well relativley) sold it to INFOGAMES. I am not sure if the rights to TOS etc. went with the name. I guess if you wanted to find that out you would have to send some sort of legal letter.....

DID you disconnect the BG signal (jumper trace) on the nova adaptor ???
I assume you soldered 2 mal/mal connectors on the nova adaptor to be able to plug the CT60 on it... ok ?
But you need too to cut the trace between the pins #20 & #22 on the J20 (30 pins).

The software box I have has Atari's logo on it, and as I neither knew what the
chain of awuisition was, not does the box have either of these other two
companies on it (and the other company that IS on the box (Artifact
Entertainment) has no means of contact either...That and it does say
"Manufactured and marketed by Atari Inc. New York"

And all I want to do is return the darned thing! (Comp USA won't take it 'cause
it's opened, despite the fact that I never used it...)

A good advice is to filter him out if you don't like what he writes.
Afaik this is quite easy in Newsie.

When someone posts offending material do a search for his (female tend
to not post offending material...) previous post on Google Groups. If
there is little of interest add him to your killfilter.

Saves both your time and nerves...

Peter,

Gaim will have to be recompiled specifically to allow other modules to
work. I will compile and upload separate tar.gz's with gaim executables
linked with other plugins.

I will now hold a vote. What do people want. Right now it will be libgg
and yahoo alone in separate binaries. But you can have any combination of
plugins compiled in.

Thanks,
Mark

Have Newsie installed but havn't used it much as it can't handle ï¿½ï¿½ï¿½ and
other important characters properly...

Using Newswatch online and Newsie for reading/writing would be an
alternative.

It's a pity both Newswatch and Popwatch are out in the cold now.
Excellent programs but there are some minor bugs left...

Again, thank you. Samsung's web site speaks Java, so it's no go from this machine, but I will get a copy of the data sheet.

There may be six more sticks of this size where I got them, if anyone still needs them. This assembly is in my spare machine, so investigating this problem will wait.

I will check out the size pins, once I know where they are, although an open path is hard to get wrong. And, I will try moving the wait state jumper, but a wait state error would have to miss every other byte to do what I observed.

At least now I know that the sticks are really 128 MB, and there is a fixable problem. I do have enough parts, modules and memory, to do some investigating, but I will not have a use for that machine for about six months. This one has 128 MB as 16 16 MB 30-pin SIMM, which cost much more than the Magnum module and 72-pin SIMM.

Thanks again for all the help.

Jim

Also, try http://www.dhs.nu under music (or sound) tools. There are lots
of ym/mod editors there (one the most advanced ones being Sid Sound
Designer, or SSD to its friends!)

Now, flood us with your ym creations!

No time to get there, wanted too, and the wife said go. But, it all got away from me. Kids had a ball tho:-). Hope to get along soon. As for the shrimp, they were prawns actually, but hell it is easier to explain to the northerners, eh.

Sure? TOS stops at the dirst error it finds and uses everything up to that
location as "good" memory (maybe rounded down a bit), so if you do have a
timing problem, it may well happen just after the beginning of a new memory
bank due to slightest timing variations.

I've tried just about every key combination including control+alternate,
but I still get the three bombs. If I just press escape to bypass the
memory test, I get four bombs instead. I still can't get the Falcon to
boot, and I'm probably going to just yank the HD out of the Falcon and
see if I can get it to boot that way. Any other ideas?

8153. OT: (Plz Forgive) Super Amazing Gigantic Computer Collection

Newsgroup: comp.sys.atari.st
Date: 2003-12-29 04:49:52 UTC
From: "mark@mmhart.com" <mark@mmhart.com>
Message-ID: <5hcvuv8hp2ct8dv6125k175so5pu0tnm6m@4ax.com>
Source record: 22035

(Sorry this is OT but I wanted to ad to the hard core folks who might be interested in this)

I am selling a vintage computer collection that I have been working on for almost 10 years. It contains many computers from many different companies that span the late '70s, 80ï¿½s, and early '90s. All systems come with original software, manuals, books, magazines, videos, keyboards, monitors, mice, etc...

I have also tried to collect very interesting and rare items including an original 1978 Apple II Reference Book from Apple, twin Macintosh 512ks with some fantastic accessories, a complete TRS-80 Pocket II Computer, and many other items.

I could not possibly list everything that I have so I created an entire web site (not a page) so you can browse through the pictures, background, statistics, and other information. I have treated these systems with the greatest care and I think youï¿½ll see that when you browse through the gallery.

I have been approached by many people to split up the collection but I would rather not. My hope is that this collection will be purchased by another collector (new or established) or a computer museum and added to their history of digital technology.

If the winner wants to do shipping then they will be responsible for paying for it, however, it might be better to arrange for the winner to pickup the collection. We can work something out.

If you're a fan of Commodore, Apple, Macintosh, Amiga, TRS-80, Timex, etc...you'll at least want to browse my pages for a trip down memory lane.

I'm asking: $580.00 OBO

If you have any questions, please do not hesitate to ask.

You can go to http://www.mmhart.com/Collection.htm for more information, pictures, etc...

Thanks!

Try the demo version of HDDRIVER, which in contrast to most other
drivers is still maintained and also supports big IDE drives:

8155. Happy Holidays! GAIM Update!

Newsgroup: comp.sys.atari.st
Date: 2003-12-29 07:46:54 UTC
From: Mark D <mducksub@nossspamXXatari-source.com>
Message-ID: <pan.2003.12.29.07.46.53.709428@nossspamXXatari-source.com>
Source record: 22037

Hey guys,

As posted to http://portal.atari-source.com:

Hey folks, as a nice holiday present to fulfill some wishes out there I have compiled a nice present for you all. Gaim with all plugins compiled in. Now nearly every IM protocol is possible from Atari! With debugging symbols removed and stack size fixed this binary seems a bit faster! After downloading, perform the following! gzip -d gaim_all_plugins.gz, cp gaim_all_plugins /usr/bin, chmod +x gaim_all_plugins, start your x server, run it, and chat with YOUR favorite protocol. Unfortunately MSN doesn't work :-(Thanks MS, *flicks the bird*, however gadu gadu, jabber, and yahoo should (hopefully) still work. To get MSN we need to get gtk2 port done. When gtk2 is done I am in a better position to start aesvdi-gtk2 and then possibly we will have some speedy unix programs running on atari without an x server! Happy Holidays!

PS: Only use if you have gaim RPM installed already!

As always, the obligatory screenshot:
http://toad.atari-source.com/~mduckworth/all_plugins.gif

And the binary:
http://toad.atari-source.com/~mduckworth/gaim_all_plugins.gz

Thanks!,
Mark

Thanks Mark. I've just been trying it.

When I start Gaim I get this error but I suspect it may not
be anything to do with the binary and is probably just my X set-up:

** CRITICAL **: Failed to assign /usr/tmp/gaim_Peter.123 to a socket (Error: Invalid
argument)

I tried connecting to Yahoo. It briefly tries to connect and then
says "my-user has been signed off: unable to read"

Could this be a file access problem ?

Sorry to bother you with simple stuff like this, I know your
aim is to port Gaim to GEM. I noticed that the binary isn't

much larger even with the extra modules.

Merry Christmas and Happy New Year,

Peter

PS My holidays aren't until next year ;-)

>able to plug the CT60 on it... ok ?
>But you need too to cut the trace between the pins #20 & #22 on the
>J20 (30 pins).

Yes, I did all that. When I did my first tests the NOVA software refused to work (it crashed at startup) but after I flashed to the latest ABE/SDR and TOS 0.99g the software didn't crash any longer so I removed the NOVA card from my second falcon and reinstalled it in my ct60 falcon.

Unfortunately this time I had these weird effects. When I tried it for the first time (with the old SDR/ABE) the logo wasn't distorted so I suppose that it might be the connectors.

Well, due to the reason that it is always a LOT of work to remove the NOVA from one falcon to the other I wanted to know whether someone already has been succesful.

Regards,

Frank

8159. Re: MagnumTT Ram Card and types of Simms?

Newsgroup: comp.sys.atari.st

From: Jim DeClercq <jimd@panix3.panix.com>
Message-ID: <bsps8v$k00$1@reader2.panix.com>
Source record: 22039

Thanks again, Michael

Another layer of complication. Right now, I have the data sheet saved to disk for sneakernet printing. There are two different speeds available, 50 ns, or -5, and 60 ns, or -6.

Table
50ns 60ns
PD1 NC NC
PD2 Vss Vss
PD3 Vss NC
PD4 Vss NC

Note that both are 128MB size pin lists and that they differ. I have the -6, 60ns memory.

You seem to have quite a bit of familiarity with the Maxon board. It looks to me as if it is expecting all four pins to be identical. So I either need to cut a trace, or add three Vss wires.

So, can you tell me what the memory module is expecting in order to treat the SIMM as 128 MB?

And by the way, I think you are right about what a timing error could do. But first, the presence pins need to agree with what the memory module expects. Right now, I do not think they do.

Jim

I have the same board and am unable to get any SIMMs to work. I get a black
screen when the TT RAM board is installed. I tried several types of SIMMs,
EDO and FPM. Do you know what types are the BEST? What about 2k and 4k
refresh? I have some FPM 60ns 32MB SIMMs and they also do not work. EDO
32MB 60ns also don't but I figured EDO should be avoided anyway. I wonder
if my TT card is bad? Should the TT power up with NO simms installed? Mine
doesn't.

Thanks
Tim

A couple of years ago, I bought Wavemaster from soundpool, and it came on a disk with text in German. Does anyone have the manual in english, or know where it can be had?

Thanks!

Wayne Martz

Anyone,
Does anyone have any information on the F/X BlowUp
card for the Falcon 030?? I just acquired a Falcon
030 with this card in it and wish to see technical
specs on this card. Any web-sites or information on
this card would be greatly appreciated. I also
acquired a 1040 STf with 4 megs of STram soldered in
place and this 1040 STf has a PC Ditto II card
soldered on to a LONG chip in front of the DISK DRIVE.
Any information that someone can provide for this
adapter would be greatly appreciated also. The board
is about 1 inch by 3 inches and has 2 rows of pins the
whole width (3 inch direction) of the board. If
anyone knows what this board is and how I can utilize
its capabilities I would greatly appreciate the
information.

Thanks,
Carey Christenson

/ | \
/ | \ High Flying Falcon 060!!!

Falcon 030 @ 16 mhz. with 14 megs STRam
CT60 68060RC60 @ 72 mhz FPU and PMMU built in. Kingston 512 Megs PC133 SDRam

Yep, life is a bitch... deal with it.

8167. HighWire 0.1.6 is released

Newsgroup: comp.sys.atari.st
Date: 2003-12-29 23:55:37 UTC
From: gokmase@bigfoot.com
Message-ID: <366c6d2a.0312291555.2c46f63@posting.google.com>
Source record: 21948

Welcome to the latest release of HighWire, 0.1.6!

As I write this Developer letter it strucks me that this is our 3rd
Christmas (oh well, slightly delayed, but still..) release!

I'd like to take a moment to thank one person behind a lot of those
hours
of coding, Ralph Lowinski (aka AltF4). Without his dedication and
skills,
HighWire would NOT be what it is today!

So what is new with in this release? First of all it should be pointed
out that
more than anything else, the aim with this release was to clean up the
things that
were new to 0.1.5 and increase overall stability. Even so, there have
been some
additions as well. Here is a list of some of the most significant
changes:

* The cache system has been reworked, cached files will now be used
over subsequent sessions
* The reload button performs a reload of online pages, not only a
reparse from the cache
* Implemented basic CSS support for BIG, SMALL, FONT, SUB, SUP, H1..6,
P, DD, DT, DD and SPAN tags.
* Parsing of <STYLE> areas
* Pop-ups are now aligned always to the screen extents
* Meta tag 'http-equiv=expires' implemented
* OVL for the TCP/IP stack iConnect added

See the Change.Log for more details of updates and the
example.cfg/highwire.cfg
for explanations of new configuration keywords!

Now for another repeat, Baldrick's call for volunteers:

If you are interested in helping with the HighWire project, don't
hesitate to get
in touch with any member of the development team and let them know.
There are lots
of areas where more people would make the job easier. If you can't
program, then
consider helping with the documentation or get involved with
submitting bug
reports. If you are a programmer and are interested in working on the

code of
HighWire, then definitely get in contact with the development team.
Translations
into other languages would also be a nice addition to the project.
While we have
many different languages spoken by members of the development team, we
only have
language support for French and English.

Not only is a modern browser needed for our platform. It is our belief
that our
best option is one that is native and open source. To reach that goal
we will need
time and the help of community.

Thank you,

ï¿½ HighWire Development Team

AFAIK Wiztronics bought the rights to TOS. They were at World of Atari 1998 show in Las Vegas showing off the Lynx Vision device to play Lynx games on a TV. It was there that I talked with them and they indicated they bought TOS from Atari when they were closing down. Don't know if they still own it.

>

I did try the demo version of HDDRIVER before I used CBHD, and it did see the HD without a hitch. I just wasn't able to partition or format the drive due to the limitations of the demo version. The problem now, though, is that I can't get the Falcon to boot with the HD in. I've tried all of the key combinations that have been suggested with and without a disk in the floppy drive, but the Falcon continuously gives me three bombs just after the memory check. The only way I can change it at all is by bypassing the memory check (pressing escape), but then I get four bombs instead of three. As I'm unable to get to the desktop, it appears my only option is to remove the HD and see if I can at least boot from floppy. Rest assured, though, I'll most likely purchase HDDRIVER if/when I can finally boot my Falcon again. :)

A couple of months ago I tried disassembling cbhd.prg and comment it 100%.
This was done becuause my brother would build a SCSI interface for the ST
(I just wanted to learn a bit about how the o/s deals with hard disks :).
Unfortunately, as the hardware part was abandoned, so was the software. I
could try looking at the semi-commented source to see if I can find the
combinations for skipping hd boot. Perhaps I'll try continuing that idea
someday. (btw, what is the status of CBHD? Mabye I could release what I've
done so far)

This is correct. PD1/PD2 encode the memory speed (and are ignored by the
MagnumTT), PD3/PD4 encode the size - these are the ones of interest.

>So, can you tell me what the memory module is expecting in order to treat
>the SIMM as 128 MB?

PD3 and PD4 need to be open (ie. not connected to ground) on the module. The
size jumpers on the Magnum are in parallel to the PD3/PD4 pins on the SIMM
socket.

Even without any SIMM in the sockets? If so, either the card or the TT is
broken, no need to test different SIMMs.

>EDO and FPM. Do you know what types are the BEST? What about 2k and 4k
>refresh? I have some FPM 60ns 32MB SIMMs and they also do not work. EDO
>32MB 60ns also don't but I figured EDO should be avoided anyway.

Not really - the MagnumTT can handle both FPM and EDO. The refresh must be
the correct type for the size of the module - 2k/4k refresh also indicated
the number of address lines used during RAS/CAS cycles - these must be the
same (symmetrical DRAM array). If in doubt, try to get the datasheet for the
DRAM chips on the modules.

>I wonder if my TT card is bad? Should the TT power up with NO simms
>installed? Mine doesn't.

That sounds like a bad card or a bad TT - without extra hardware to
swap-test, it is difficult to determine which of the two is bad.

> In general I'd say that you can run two or three not too demanding apps
> under Geneva in 1MB RAM. Sufficient for your purposes?

No. The Tandy Color Computer 3, under OS-9 Level 2 with Multi-Vue environment, can run up to 13 apps in 512k. Under Basic-With or without Window Master (prefereably with) it can task switch between 4.

Even with a ton of extra features, and alowing for a little unavoidable bloat, I still can't see alowing one program to use more than 64k for itself and exept for graphics, most people don't need more than another 64k for data.

I guess the Atari ST is just another bloatware machine just like the pee see, mac, and amiga.

I'm going back to comp.sys.atari.8bit, where they talk about good computers.

Peter,

Actually my aim is to port gtk to vdi/aes so that all of the applications are as native as they can possibly be. Which will happen once Keith Scroggins completes the all important groundwork (which I bet he doesn't know is that important to me ;-)). Anyway, in the mean time I've been learning a lot about vdi/aes by writing my very own instant messenger client called GIM (GEM Instant Messenger). Realistically this is my goal - a native application. It'll be pretty cool because it'll have built in support for both MiNTnet and STiK and will be able to handle protocol plugins which will be documented and others can write or hijack directly from gaim (as I intend to do).

As far as yahoo, sounds like they broke compatibility since the relatively old 0.59.9 came out. This is the last in the gtk 1.x series of gaim. Since we don't have gtk 2.x ported yet, we can't use newer versions. However, I'll look into backporting current plugins to this old version. I suspect the underlying code there hasn't changed much and I should be able to sub in some source code here and there. We'll give it a shot!

Thanks,
Mark

Also, Regarding that socket issue, that's Gaim trying to create a socket to use socket based communications with the xserver which I believe it doesn't support. That's where this error is coming from as far as I know. The Atari x-server must communicate over network only using the local ip (127.0.0.1) further slowing things down.

A completed xserver will have socket based communications (speed) and direct bitmap copying for local applications (even more speed) ;-). So perhaps all our porting work is unnecessary but I don't have the time nor the qualifications to finish the x-server properly. AltF4 would have to do that and he's working on much bigger and better things, Highwire. (thanks altf4).

This is primarily to Uwe, but there are others that might want to address it or benefit from it so I chose a public forum.

First and foremost, I have the biggest feeling that 99% of my falcon problems are due to SOMETHING being wrong with st-ram access. Fast-ram is fine, and st-ram works 99.99999% of the time. It's just that 1 bit of memory every now and then being broken that really messes things up for me ;-). Anyway what _I_ think is going on is that based on my tests, certain very important things are still using ST-ram instead of fastram.

The 2 important things I noticed are HD-Driver itself installs it's binary to load into st-ram not fastram (none of the flags are set). I set the fast-ram flags and everything seems to work. So that begs the question. Is it really loading into fastram? And is this okay?

Secondly hd-driver caches are definitely loading into st-ram too. Which would explain why my system tends to fail under hard disk access (compiling with gcc), and be fine under light disk access (playing mp3! which it can do under aniplayer for DAYS!) Is there any way to force these caches to use fastram to get some additional speed as well as possibly work-around my bad falcon st-ram. (note. this problem is exhibited using a NUMBER of st-ram cards, the problem is my falcon, not the st-ram board).

In addition I had some questions about mint. Mint binaries do not have such flags, leading me to believe some sort of dynamic allocation is involved. So that begs the question. How much do mint executables touch st-ram? Do they use fast-ram until it runs out and then fall back on st-ram? Do they use st-ram for some things here and there or not at all if htey don't need to?. The sooner I narrow down exactly what is using the remaining 2.2 megs of st-ram the sooner I could have a stable system.

I also calculated 640x480x8bpp to be 1,228,800 bytes which means even if hd-driver caches are using 163kbyte of st-ram there's still some other software sitting in there. Anyone have ideas?

Thanks,
Mark

I mean this in the nicest way possible, but, if you haven't noticed in the
last 5-7 years, the social connotation of "retard" has become that of
"idiot".
Also, I personally haven't seen or heard any references in the real world of
this being associated with people having learning/behavioral disorders in
probably 10 years now.

P.S. You would be wise to know that not many here really care about being
politically correct, so be prepared to...no...EXPECT to be offended in the
future, if this sort of thing bothers you. If you can take it with a grain
of salt, however, there are some really good discussions here, and one may
glean much atari-guru-ness from them :)

8183. [UTD] January Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2003-12-31 08:55:48 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <bsu2td$lu6$2@news-reader5.wanadoo.fr>
Source record: 21964

Happy new year, and best wishes for you,

The software "Eureka" is updated and released on its WEB page.
It is a "2D Graph Describer and 3D Modeller". It is updated
nearly every month, if I found significant improvements for it.
You will have to fetch it at :

http://eureka.atari.org/eurka401.zip
That is the Complete Common Edition

http://eureka.atari.org/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.atari.org/eurka020.zip
Is the Complete 68020 Edition

http://eureka.atari.org/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.atari.org/lib_dgem.zip
Are Dynamic Libraries Extensions for Eureka

http://eureka.atari.org/tiny045.zip
Is the OpenGL Extension (requires previous package)

Eureka takes advantage of a new GEM library, and
various corrections / optimizations.

I wish you big fun with all this new STuff !

Best regards,

-- Franï¿½ois LE COAT
Author of Eureka 2.12

>"idiot".

Let's look in the dictionary ...

"Idiot - person so deficient in mind as to be permanently incapable of
rational conduct, stupid person, utter fool."

"Retard - backward in physical or mental development."

"Piss off (vulg). - go away"

"Vulg" is the abbreviation for vulgar, defined as follows... "used only
by those who have no wish to be thought either polite or educated."

Source - "The Concise Oxford Dictionary" - (sixth edition).

>Also, I personally haven't seen or heard any references in the real world of
>this being associated with people having learning/behavioral disorders in
>probably 10 years now.

My point is simple. The comment "Piss off you retard!!." was designed to
be offensive to the original poster. It used language that has no place
in this newsgroup, and in colloquial English "retard" is used as an
insult towards someone who is thought of as being "slow" mentally.

>> Please give some thought to who you may be hurting and upsetting with
>> comments like this.
>
>You need to look at the context, not just the words.

I did look at the context, and could see no justification for the use of
those words.

>P.S. You would be wise to know that not many here really care about being
>politically correct, so be prepared to...no...EXPECT to be offended in the
>future....

Have you taken a poll of posters to see how many are concerned that the
language they use is appropriate and doesn't offend others ?

I have followed this group for several years now, and I find the vast
majority of posts are helpful, polite and very informative. Yes, there
are some arguments about the merits of different software etc. but these
can provide valuable information - and sometimes even fun for the
onlookers :-)

>...if this sort of thing bothers you. If you can take it with a grain
>of salt,

Most times I do, as replying often provokes more offensive posts, but
this was an unpleasant and vulgar attack directed personally at the
original poster and hardly in the spirit of the festive season.

>.. however, there are some really good discussions here, and one may
>glean much atari-guru-ness from them :)

Here I agree with you completely !

Paul

My thought being, that those resorting to crappy language and insults
in most cases are NOT the ones contributing much in making this forum
an interesting and useful source for knowledge and sharing. I
completely agree with Paul here, if you can't say what you want to say
in proper English, perhaps you don't have a point.

Happy new year to all btw ;)

Source record: 21968

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=3069068209&category=125
0

Made by Third Coast Technologies of the UK. This is a 20MB drive in a very strong (and quite heavy) steel case. The actual drive inside it is a Seagate ST225N but I'm sure it can be easily changed for a larger drive (20MB was plenty when I bought it). I've had it from new and it has been in the loft for a few years but I had it down at Christmas and fired it up, all works fine. The ST can boot from the drive and the drive is currently partitioned into three logical drives. It comes with the DMA lead to connect to the ST and a standard 'Kettle' type power lead. the original manual is included as well as the software disk and some utilities. It's quite heavy so would probably be better collected but I will post in UK if required.

8189. FA: Atari SM124 monochrome monitor in UK

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=3069067092&category=125
0

What can I say really about a monitor. I bought it new a long time ago, used
it for several years and then it went in the loft. I've had it running over
christmas and all is fine with it. Good stable display with lead to connect
to STFM or similar and power lead., heavy item so better collected but I
will pack and post in UK if required.

8190. FA: in UK ATARI 520 STFM 2MB & ATONCE IBMPC emulator

Newsgroup: comp.sys.atari.st
Date: 2003-12-31 14:03:26 UTC
From: big chris <bigchrisrogers@SPAMNOThotmail.com>

Source record: 21970

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=3069009740&category=385
97

This was my main machine for several years but has now been unused for some time. I've had it up and running over christmas and all is fine. It has Xtra-ram 2Megabyte internal expansion board. Interestingly it also has the IBM PC emulator board from Vortex with on-board 80286 processor running at 8MHz which allows it to run DOS based software. The internal disc drive was chaged for a double sided drive so can handle 720K discs. However, this drive is higher than standard and so the case does not close completely. It has the origianl Atari mouse which works but the left button is a little temperamental, sometimes taking a few presses to register. There are around 200 disks also included with the machine. I guess around half of these are cover disks from ST format, ST review, etc. Some are from foreign (German, Canadian,) magazines. A good portion of the disks are from shareware houses, mainly MIDI, C programming (editiing,compilers, libraries etc), assemblers, documentation on GEM, TOS etc, and a range of utilities and other software. Original discs also include Home Accounts 2 from Digita International, The Hitch Hikers Guide to the Galaxy, DEVPAC ST from HiSoft, Esytext Plus wordprocessor, Personal Accounts plus, Your Second Manual and driver software for the Vortex IBMPC emulator. Visually the machine is not in brilliant condition and would benefit from replacing the disc drive with a shorter one that would allow the case to close. The machine does work fine though.

8191. Got a Falcon.. now what?

Newsgroup: comp.sys.atari.st
Date: 2003-12-31 15:15:13 UTC

Message-ID: <plp5vv0q97b4a6ksqr5sie01k71ej9i8lb@4ax.com>
Source record: 21973

Total noob alert... Only used an ST last about 10 years ago...

Got myself a German Falcon, now with English keyboard fitted. There is a HD fitted but it does not boot... might be knackered or no driver installed or blank.

Questions:

1) How can I find the TOS version?

2) How can I find the Ram size. I recall 4mb being mentioned but it could be less (need to UG) or more?

3) How can I change the NVRam settings to get it in English?

4) OK, when its in English what is the best way to go about getting her up and running... hard disk software perhaps?

5) Can I use PC Formatted 1.44Mb drives and just copy files onto these on my PC and then read on Atari. ISTR that ST's read PC disks fine.

Any help mucho appreciated

Meth

Do you speak about a new modified 060 nova driver or the orginal one ???

If nobody patched the driver, it may not work !
If there is no board, the driver sees that and some accesses to the board
are not done !
So, the fact that the driver runs alone doesn't mean that the driver is good
with 060 !

Just got my Falcon and have identical problem having used CBHD.....
great....

Anyone got any REAL help?

Made some progress. After much frigging around Ctrl and Alternate DOES
eventually stop HD booting (with Abort message) and I managed to get
AHDI on it. Now it boots to HD fine.

Next problem.. what to put on it, where to get RGB adaptor or VGA
adaptor at sensible price ....

Goto configuration or desktop settings, not in front of a falcon now, and
see free mem, or just use SYSINFO
>
> 3) How can I change the NVRam settings to get it in English?

Grab a NVRam type tool that does that. Search Google for some, Or go here:
http://www.seimet.de/atari_english.html The Author of HDDRIVER has one on
his site:

>
> 4) OK, when its in English what is the best way to go about getting
> her up and running... hard disk software perhaps?

HDDRIVER ($50) or other HD software prep. AHDI V6 (free) for smaller HDs
(2GB or lower)
>

Congratulations on a fantastic atari 8bit and st resource, easily one of the most complete on the 'net.

I've just spent a pleasurable afternoon making my collection complete (almost), very many thanks.

Hi Ozk!

O>They are? Where? You do mean ALL the sources? If you have that, could
O>you please mail it to me at the mail addy in my sig?

All I've got is included in the CBHD502 package, available e.g. on
http://storage.atari-source.com/atari/mirrors/ftp.lip6.fr/pub/atari/Disk/

Well, and of course I've got the original from the famous "Scheibenkleister"
book, including the book, but that's fairly outdated.

Can you recall the exact steps you took to actually get it to stop HD booting? What I've been doing is holding down Ctrl + Alt while turning on the Falcon. I keep holding both of those keys down until I see the bombs.

Hi all. I sold my atar 1040 ST 2 years ago... and the fellow who
bought it didn't grab the ICD FA*ST Hard Drive Case.

ICD, Inc.
1220 Rock Street
Rockford, IL 61101-1437

I bought this new in 1993 with a small SCSI hard drive for $700
Canadian... (imagine)

This was by far the greatest addition to my Atari... fast access to
all my programs and it made making music on the machine a dream.
Kinda wish Atari's music machines would have kept going.

I'm wanting this to go to a good home so... I'm open to offers. The
controller card alone was $100 usd the last time it was sold.

The last version of AdSCSI 6.5.5 Software is available for download.
http://www.icd.com/atari/adscsi.zip

So make me an offer. I would even consider trades for older drum
machines or tone modules.... then again cash is always nice.

:o)

Happy New year
email me please bassist_ at hotmail.com

Well what do you know...I futzed around a bit more myself with using Ctrl + Alt to boot, and I eventually got it to work! Booting up with AHDI does help, now I guess I would like to get my hard drive bootable without having to use the floppy. BTW, what I was doing wrong was holding down Ctrl + Alt before powering on the system and keeping it held down. I got it to work by holding down those keys right after turning on the Falcon but before the Fuji appeared. Thanks for your help guys!

Well there you go, i cant win, i resort to dictionary standard English and i
still cant get it right!!. 8~)

I think I'll just go back to straight forward abusive tones.

Methinks you assholes just like biting chunks out of my arse. 8~)
